

# iTouch 3D Pen

3

D printing has become all pervasive, from metal printing complex parts in the aircraft industry to Rep-Rap home printers that bring your imagination to life. iTouch 3D Pen takes it one step further by making 3D printing even more affordable, space-saving and it gives you complete freedom since it comes in a form factor that's all the more recognisable – the pen. The iTouch 3D Pen can use both PLA and ABS filaments, there's a simple temperature toggle on the top-face of the pen that

allows you to switch between two temperature levels. Speaking of filaments, the iTouch 3D Pen comes with two coils of filaments of different colours.

Certain prints require more articulate movements at lower speeds whereas simpler prints can be done at higher speeds. Also, not everyone is comfortable

operating at the same speeds, so, the iTouch 3D pen comes with four speed settings. Also, you can always tap the start/pause button if none of the speeds settings agree with you.

The package also comes with several stencils and drawing templates and there's even a translucent heat-resistant tracing panel which makes it very easy to separate prints after you are done tracing. And, there's even a little vertical stand. Overall, the iTouch 3D pen is more of a complete package to get your new hobby off to a running start.

*Note: PLA melts at 60°C so use the low temperature for that and high temperature for ABS filaments.*

# GoQii Vital 3.0

T

he Goqii Vital 3.0 smart band is the latest from Goqii, and comes packed with features to track and measure heart rate, blood pressure, and sleep. The Vital 3.0 takes it a step further by also being capable of being able to track body temperature. This is a step taken by the company to help with early detection of COVID-19 symptoms. To ensure the accuracy of their temperature sensor, Goqii teamed up with German health tech company Thryve.

The band is available in India on an immediate basis for frontline workers, which is commendable.

Coming to the band itself, we've got a full-colour and waterproof display. On a single charge, the device can run for around a week, which is pretty impressive. Also, you can receive messages, calls, and other notifications via the smartband.

Then there's the usual tracking features, such as steps, distance, calories burned etc. Even more can be done with the Goqii app, which offers courses and exercises to help with diet and exercise.

# NoiseFit Endure

R

ight out of the box, the NoiseFit Endure is a very good-looking watch. The model we got in particular had tan straps, which looked aesthetically-pleasing. Additionally, with a case made of polycarbonate material, the watch itself is incredibly lightweight, weighing just 48 grams. The straps have a silicon base, and feel pretty grippy, which is nice.

The screen is also pretty large, at 1.28". The TFT LCD screen features full-touch controls, and there's 100s of watch faces to choose from. As far as specs are concerned, the

watch uses Bluetooth 5.0, has most of the sensors you'd expect from a smartwatch, such as a heart rate sensor and acceleration, it comes with a magnetic charging dock in the case and holds a 460mAh battery. This offers 20-day battery life, we're actually quite impressed by the battery life on this. On standby the watch offers 30 days of battery life.

The watch comes with an IP68 rating, so dust and water resistant up to 1.5m. For the price of ₹4,499, these are all pretty impressive specs, especially the battery life.
