235 million user profiles from Instagram, TikTok and YouTube leaked

Reportedly, 235 million public profiles of Instagram, TikTok and YouTube users were leaked online following a database leak by Hong-Kong based, Social Data. According to Comparitech researchers who published a full report on the data breach, the leaked database contains names, contact details, personal information, pictures, detailed account insights and more such private data sets. The technique used to collate such a large database is called web scraping wherein an automated script collects bulk data from website and web pages. After Comparitech reached out to Social Data, the company acknowledged the exposed databases and took them down. However, it is unknown how long these unsecured databases were lying around before being taken down.

Oppo F17 Pro

The Oppo F17 Pro, along with its non-Pro variant, are confirmed to launch in India on September 2. The Oppo F17 Pro is expected to feature a 6.4-inch Full HD+ resolution AMOLED screen with a dual punch-hole cutout for the two selfie cameras. The F17 Pro is slated to be powered by MediaTek Helio P95 chipset, paired with 8GB RAM and 128GB storage. It runs on ColorOS 7.2 out-of-the-box. It also comes with a quad-camera setup on the back including a 48MP primary camera, an 8MP ultra-wide-angle camera, a 2MP macro camera and a 2MP depth sensor. On the front, there's a 16MP primary selfie camera and a 2MP depth sensor. The rear cameras can record in up to 4K UHD at 30FPS. The phone could come with a 4,000mAh battery with support for 30W charging courtesy of VOOC 4.0.

APP WATCH

ARCore Depth Lab

Google has been improving and testing depth capabilities in its ARCore framework since 2019. This allows digital objects in AR to hide behind real-world items. The company has started pushing out the ARCore Depth API to numerous compatible devices. The API allows smartphones to generate depth maps without IR sensors and depth cameras, so even standard smartphones can benefit from the feature. An AR character will now be

able to hide behind real-world obstacles if the camera is capturing the obstacle blocking it. This is great since it improves the immersiveness and makes AR objects blend into the surroundings. The API also enables certain physics-based features such as

AR objects going down stairs, bouncing off walls, and more. Google recently launched an ARCore Depth Lab app to show off the slew of features they have developed. Some features

include AvatarLocomotion – where the user sets waypoints on the surface of uneven terrain that the AR character stays close to, Collider – uses screen-space depth meshes to enable collisions between AR objects and the physical environment, DepthOfField-Effect – where a scene has a simulated Bokeh fragment-shader effect, FogEffect – contains a fragment-shader effect that adds a virtual fog layer on physical environment, and others. The app consists of an array of ARCore Depth API samples that provide assets using depth for geometry-aware features in AR. The depth mapping examples that you can try out via the app (if your phone is supported) are fun to mess around with and show you what the future of AR games, and AR in general will look like.

Oto Music

A nifty offline music player that comes equipped with chromecast support, gapless playback, sleep timer, and an inbuilt equaliser. The player also comes with a dedicated Dark Mode and Power Saver Mode.

Horizon Camera

Horizon Camera allows users to capture landscape videos and photos no matter the orientation of the device. You can hold it upright, sideways, or even keep rotating while capturing, and the output will always be horizontal!

Moj

Moj is a Made-in-India short video app that comes preinstalled with numerous filters, special effects, and editing tools. The app is available in 15 Indian languages such as Telugu, Marathi, Gujarati, Odia, and others.
