

## Get rid of Google Analytics

Google Analytics is bad for users and slows down the website, here are the other ways users can be tracked. <http://dgit.in/sep20-27>

## What is a closure?

You have probably used a function that accesses an externally defined variable, known as closure. <http://dgit.in/sep20-28>

having seen

or heard  
of one or the other. So all  
life is a great chain, the  
nature of

which is  
known whenever we are shown  
a single link of it. Like all  
other arts,

the Sci-  
ence of Deduction and Analy-  
sis is one which can only be  
acquired by

long and  
patient study, nor is life  
long enough to allow any mor-  
tal to attain

the  
highest possible perfection  
in it.'" [Doyle, 1893b]

### Elegant:

```
<ul class="page_nav">
  <li><a
id="previous" href="sm3.
html">Previous</a></li>
  <li><a
id="home" href="booktoc.
html">Home</a></li>
  <li><a
id="next" href="sm5.
html">Next</a></li>
</ul>
```

```
<h1>Chapter 4: Deduc-
tion and Logic</h1>
```

```

```

```
<blockquote>
  <p>
    "The supreme
task of the physicist
is to arrive
at those universal elementary
laws from which the cosmos
can
be built up by
pure deduction. There is no
logical path to these laws;
only
```

intuition,  
resting on sympathetic under-  
standing, can lead to them."

[Einstein,

1879-1955]

```
<blockquote>
  <p>
    "'From a drop
of water,' said [Sherlock
Holmes], 'a logician
could infer
the possibility of an Atlan-
tic or a Niagara without hav-
ing seen
```

or heard of  
one or the other. So all life  
is a great chain, the nature  
of

which is  
known whenever we are shown a  
single link of it. Like all  
other arts,

the Science of  
Deduction and Analysis is one  
which can only be acquired by  
long and pa-  
tient study, nor is life long  
enough to allow any mortal to  
attain

the highest  
possible perfection in it.'" [Doyle, 1893b]

```
</p>
</blockquote>
```

Now these are two ways of putting information in HTML. The first approach uses a table with a lot of inline CSS and a lot of classes which aren't referenced anywhere else. Whereas the second code does away with all of the unwanted classes, replaces the table for a simple list and uses the proper H1 tags. This is helpful with SEO as well since search engines tend to pick up on these tags rather than go through the CSS to figure out which line has the highest font-weight and assume it to be the title or leader or sub-head within the page. And if it wasn't obvious, the second code is way easier to read as well.

## AN EXCUSE

In the corporate environment, code optimisation is often used as an excuse for bug hunting. Managers who don't have a background in development often end up committing to unrealistic deadlines and the developers have to put together a barely functioning module within the deadline. Then the development time goes into extension and that's when the actual work happens and all bugs are removed. This extension time is often marked as "Code Optimisation" on the Kanban board. If you're a developer, we're sorry for outing you guys, and if you're a manager, you're most likely the problem why this happens in the first place.

## A REALITY

Another rabbit hole that people tend to fall into is when they try to optimise too much. Channeling perfectionism often results in rewriting or rearchitecting entire modules to suit some inexistent goals that may end up on the future roadmap for the code. In pursuit of making the code future-proof, you end up sacrificing the present state and the module becomes unnecessarily complicated. Don't sacrifice the entire project for the sake of saving a few compute cycles. It's better to get a functional product up and running before attempting to rework certain parts.

## SO WHERE DO WE BEGIN?

Well, you should start with writing a functional code to begin with. After that, you can explore some code profiling tools. Code profilers are basically software that go through your entire code and help you identify potential performance problems so that you can fix it. Profilers can examine your code and tell you how many times a certain module, method or function is called during the course of a test run and how long do they take to respond to a certain query. They can also track the memory allocated to each function and also check if
