Teardown: OnePlus Nord

The mid-ranger creating all the buzz

Removable battery

Opening up the OnePlus Nord doesn't require heat and the phone can be pried open simply with a suction cup and a pick. There's also no wireless charging coil under the hood of this mid-ranger, which can be found on the iPhone SE 2020. Once you're inside the phone, removing the motherboard cover reveals the battery connector. The 4115 mAh battery can be removed by tugging on the handy pull tab provided.

The challenging display

The most challenging component to remove on the OnePlus Nord is the display, which is glued firmly inside the plastic bezel. To remove the display, generous amounts of heat and some precise slicing with a thin tool is required. Once the display is taken apart, you will see an oddly tilted rectangular cutout for the in-display fingerprint sensor. There's nothing else of interest underneath the display.

Replaceable components

With the bottom cover removed, an array of cables and rubber gaskets can be seen. The components at the bottom are all individually replaceable. These components include the USB Type-C port, the vibration motor, in-display fingerprint sensor and others. On the daughterboard, the display connector doesn't come equipped with a rubber gasket but the cable from the display does have the gasket equipped.
