

FRESKO V8

Funding: US\$ 54,034 pledged of US\$ 2,000 goal

Link: <http://dgit.in/fresko>

The FRESKO V8 is a nifty 5-in-1 food vacuum sealer that supports universal vacuum bags, vacuum boxes and even wine bottles! Created by Unbox Fantasy, the FRESKO V8 ensures a tight vacuum seal that allows your food to stay fresh for longer, 5x longer, as per the company. All you need to do is put your food into a vacuum bag, open the device, insert the bag into the device, close and lock it, press a single button to vacuum and auto-seal the bag. The device eliminates multiple manual operations required to vacuum and seal foods. The device needs merely 5 seconds between seals, where other sealers need to

rest for much longer, allowing you to seal bags back-to-back without having to wait for too long. The device is even compatible with vacuum seal food containers that you can buy online or in the market. The vacuum

sealed bags can be used to seal dry as well as moist food and can directly be used in the bag to cook Sous Vide recipes. There's a luminous LED ring on the device that glows to indicate Moist Mode or Dry Mode. The bottom drip tray that collects moisture from bags can be removed easily and cleaned. The design of the FRESKO V8 is streamlined, minimalistic and elegant. It's small footprint ensures that it doesn't take up too much space on kitchen countertops and its simple design should fit the aesthetic of most houses.

Blync

Funding: US\$ 15,721 pledged of US\$ 22,698 goal

Link: <http://dgit.in/blync>

The world is not exactly a safe place at this moment to pick up your bike and go on long rides, experiencing nature at its finest. It may just be the time to indulge in a bit of VR magic that can bring gorgeous virtual terrains and sprawling paths to you within the safe confines of your home. Not just the pandemic, even issues such as tight schedules, unfavourable weather conditions, and lack of biking paths in your neighbourhood can be a deterrent to riding outdoors. With Blync, a unique VR-enabled bike controller, you can ride your bike physically while traversing through various simulated environments in VR. Blync comes equipped with a path sensor and a speed sensor that allow you to not only make your way through simulated environments, but also turn and control exactly where you want to go. The device records fitness activities such as calories burnt, average riding power, and riding speed, which you can see on the accompanying app. You can also toggle between first and third-person modes, especially if first-person in VR makes you dizzy or nauseous. The Path sensor is designed to fit bike wheels of any size, all you need to do is place your bike's front wheel on the Path sensor and strap the Speed sensor onto your back wheel's hub (the round part with the wheel spokes around it). Additionally, the back wheel needs to be secured onto a bike trainer to remain stationary. If you don't have a VR headset, you can enjoy the scenic views on a PC or laptop screen.

SnapPower ConnectLight

Funding: US\$ 246,415 pledged of US\$ 30,000 goal

Link: <http://dgit.in/snappower>

SnapPower ConnectLights are easy-to-use and install motion-activated, linkable lights that can light up a pathway seamlessly when just one light is triggered by motion. This way, if you need to light up the pathway from your bedroom to your kitchen at night, a single light activated can light up all connected lights. You even have the option to set a light on Sleep Mode. So, if you wanted

to light up the rest of your house or path without turning on your bedroom light, you can. ConnectLight even supports Zone Control, where you can create multiple connected zones in different areas of your home, which will light up separately when triggered by particular ConnectLights. You can also choose how long the lights will stay on after they have stopped detecting

motion – 15 seconds, 1 minute, or 5 minutes, and even control the brightness levels – Bright, Dim or Off. The installation process, as mentioned above, is super simple and there's no need to punch holes in walls or run wires anywhere. ConnectLight's SnapPower prong technology makes it simple. All you have to do is remove the cover plate from your outlet board, snap on and screw in the ConnectLight cover plate and that's it. The outlets are free to use and the ConnectLight even detects sunlight and refrains from turning on during the day. Additionally, the company claims that the lights can last for upto 25 years. Lastly, they come with a 120-degree motion sensing angle and 30 feet motion sensing range.
