

#IndiaProject

Help us build more success stories in India, and bring true neutrality back to the internet and advertising..

Team Digit | india@digit.in

For almost two decades now, all of us at Digit have been driven by one single goal – to be India's technology navigator. We just want to do our bit towards making our nation the technology superpower we know it can (and should) be.

As a home-grown, Indian brand, Digit owes everything to the love and support of Indian technology enthusiasts like you. Over two decades, a small team of passionate technology lovers got together and built the most trusted technology media brand in India. And now it's time we paid back some of that love...

The current system in which technology brands are built is flawed. Instead of being a meritocracy, it's become a fiefdom of many gatekeepers, all working to hide those who can't cough up an entrance fee. We all know who the gatekeepers to information are – search giants, social media giants, and media companies (including us).

While there are still exceptional success stories of beating all the odds that come

from every corner of our country, we can do better. We believe that there are many more brilliant products and services, and gems of ingenuity and innovation hiding amongst 1.3 billion Indians, but perhaps they can't afford the gatekeeper's fees.

This has to change.

It should be you, the consumer, who takes the final call on whether a product or service is good or not. Every decent Indian company should be able to reach out to you and at least inform you about its offerings. While Digit exists to test products and help you navigate through the cacophony of marketing and advertising, we also have a duty to make sure you're informed of all your options.

#INDIAPROJECT

We wanted to find a way for us Indians to be able to help Indian entrepreneurs and Indian startups flourish in India, and eventually make a mark on the global scale as well. The first step towards that is to inform you of the amazing work that many Indian companies are doing, but just the odd article
