SCIENCE FICTION

Science Fiction, as a genre, has produced some of the best content in television and movies and has always been a place where directors and artists can truly go all out with the stories and tales they tell. Even in the early 1900s, the world was seeing the great potential of science fiction as a legitimate genre. As more time passed, the genre has become an important part of mainstream media with films like 2001: A Space Odyssey, Blade Runner and even films like Predator becoming some of the most influential films in the history of cinema. So, if you're a sci-fi lover, we've got a few awesome shows in store for you. Let's start things off with Amazon Prime, and then check out shows on Netflix and Hotstar+Disney Premium.

Prime Video

THE EXPANSE

The Expanse is a sci-fi fantasy show that tells the story of a brewing war between Earth, Mars and the Belters (people who live and work mining precious materials from asteroids). The show has a very accurate scientific bend to it and almost everything on the show can be explained using physics. That's one of the best aspects of the show. It also covers a lot of political intrigue and really digs deep

into what it means to be a human in a post space travel world.

DOCTOR WHO

One of the most beloved shows on television, Doctor Who has transcended the medium to become a cultural phenomenon. All 11 seasons are available on Disney+Hotstar but we'd recommend

you skip the last two seasons as they're absolutely rubbish. Instead, check out earlier seasons where the mythos of the Doctor and his apprentice have not been ruined yet. Almost every sci-fi and fantasy writer in the modern era has been influenced by this landmark show.

THE MAN IN THE HIGH CASTLE

If you're a fan of alternate histories, then The Man in the High Castle is just up your alley. The show basically deals with a world where the Nazis won World War 2

and have no taken over the entire globe. America has now been split between the Japanese and the Nazis. The show is clever, dark and is basically a cautionary tale of how lucky we all were that the Nazis did not win the war.

TALES FROM THE LOOP

One of the original Prime Video shows on the list, Tales from the Loop may not be everyone's cup of sci-fi as it is a slow and brooding show. The show tells the tale of a small town that is connected to this machine called the loop. Cue, time travel, consciousness separation and robot hijinks. If you're into smart and thought-provoking sci-fi, then this show is just right for you. Do not go into Tales from the Loop expecting a bombastic action show.

FRINGE

Before JJ Abrams became Hollywood's darling, he was busy giving us some of the best sci-fi shows out there. Fringe tells the story of the Fringe Division and they investigate cases relating to fringe science, ranging from transhumanist experiments gone wrong to the prospect of a destructive technological singularity to a possible collision of two parallel universes. It's heavy, fun and a real smart show.

Netflix

STAR TREK

The wonderful thing about the internet is that it sometimes acts as a time machine, letting us go back and experience the culture of decades past. Such is the case with the legendary Star Trek. The show would play on TV back in the
