

Voice DMs in Twitter

Twitter is about to introduce Voice DM's just shortly after their roll out of audio tweets in June. <http://digit.in/oct20-25>

750G > 765G?

According to a tipster, the Snapdragon 750G's Geekbench scores are better than the Snapdragon 765G. <http://digit.in/oct20-26>

data will actually be used for. India in the present day also doesn't have a structured data protection model.

The two main models in effect today are Article 21 of the Indian constitution and the IT act, which states that data can be obtained from the user under consent. Whereas the EU (European Union) recognised this as an issue and brought about a new privacy law called the GDPR (General Data Protection Regulation).

According to Elayne Ruane who has conducted a research on Conversational AI: Social and Ethical Considerations, "Conversational Agents are becoming ubiquitous in our daily lives. They are used in various areas including customer service, education, medicine, and entertainment. As tools that are increasingly permeating various social domains, Conversational Agents can have a direct impact on individual's lives and on social discourse in general. Consequently, critical evaluation of this impact is imperative."

The usage of AI for conversing purposes is not far away given the technological advancements and the usage of conversational AI also require a ton of data from the users side to deliver the best performance. But the users should be made aware of what the data is being used for.

CHALLENGES OF SMOOTH CONVERSATIONAL AI'S

The two main challenges of conversational AI's include-

Technological and conversational challenges:

The development of conversational AI is happening almost in an hourly basis taking that into consideration the technological aspects of conversational AI can just be considered a temporary hurdle. The answering rate and the limited number of answers to a particular question can be taken as one of the most important concerns.

Differentiations: When a conversation is occurring between a groups

of people and one of the people calls the voice assistant out the AI should be able to differentiate between the people and respond accordingly. The process of distinguishing between different questions or commands and voices is known as differentiation in AI. This is the most essential part of having a conversational AI in terms of the AI.

Emotional connect: The emotional connect between an AI and a human is the factor which distinguishes between a smooth talking

should be considered and the AI must be programmed accordingly to get close with people and actually increase the probability of customers using their AI.

FUTURE FOR THE VOICE OF AI'S

Technology has certainly become an essential commodity for us whether we like it or not. AI will certainly catch up and that will happen sooner than we actually think. Although the advancements are very rapid, there are certain prob-

AI and a Chabot. We clearly haven't reached the pinnacle of AI development considering the advancements such as this remain untouched. The AI needs to be taught with different conversational agents in order to be able to differentiate between voices and also learn different emotions in their voices and respond with the right emotion.

Native languages: Although there were huge advancements in the field of conversational AI and speech synthesis, the AI being able to speak in the respective native languages of people is still not yet very accurate. Also this is a big step in the AI building trust with people across the world. Additionally, the cultural differences of people

lems to be solved in particular areas which include communicational behavior and of course security.

Considering these as very minor hurdles in the long run, Conversational AI will surely be of utmost importance and business sectors of all kinds may start to accommodate them as a part of their establishment. And although we may work very closely with Conversational AI for the advancement of our world, there surely won't be a battle between humans and the conversational AI.

If we cross the certain hurdles in the path to normalising conversational human like AI we may actually open the possibilities of the AI being.
