

Apple made most bank in Q2

Apple made more in Q2 of 2020 than Samsung and Huawei combined, despite lower sales. <http://digit.in/oct20-15>

GAINWARD Marvel RTX 3080

Gainward has new GeForce RTX 3080 and RTX 3070 models themed after popular characters. <http://digit.in/oct20-16>

and here are some of the most exciting AI startups in India.

AarogyaAI

Winner of the Data Innovation Bazaar 2020 startup challenge, AarogyaAI has developed an AI-enabled software to help rapidly diagnose drug-resistant tuberculosis (DR-TB) using tools to analyse the samples and provide drug recommendations to treat the disease within just a matter of hours. The company collects the data of patients via DNA sequencing and offers an analytics dashboard for insight into bacterial phylogeny, its geographical influences, and other metrics. This can be used for public health programs to place PHCs for pharmaceutical companies to improve the supply chain logistics as well as the drug development program. In the long run, the company hopes to be able to predict the patterns of evolution of the bacteria and future drug resistance patterns.

Turtle Shell Technologies

Bengaluru-based startup, Turtle Shell Technologies created a device called Dozee, a contactless health monitor that can track heartbeat, sleep, respiration, and stress-recovery with an alleged accuracy of 98.4 percent. The device is capable of providing continuous respiration to a patient without the intervention of any wires or any technical expertise. Utilising ballistocardiography, where a sensor sheet is placed below any mattress upto 18 inches in thickness, the Dozee is capable of capturing the data via micro

vibrations from the human body. The data is then analysed using ML and AI algorithms to generate the health data of the patient without extraneous interference. The data is accessible on a dashboard via a smartphone app, which allows remote care to be given to the needy during the pandemic.

Agricx

A Google launchpad incubatee, Agricx is a startup that has developed a mobile-based AI solution named Procure+ that leverages ML and AI for real-time quality inspection of agricultural produce and delivers insight to stakeholders remotely. The startup aims to tackle food industry woes such as finding the right buyer/seller, easy procurement of produce, getting objective feedback across the supply chain, and others to bolster the industry. The mobile-based solution digitises the process of quality assessment with its patent-pending SaaS stack at affordable prices. It puts quality assessment powers back into the hands of the growers by converting smartphones into advanced quality assessment tools.

Haptik

Founded way back in 2013, Mumbai-based startup Haptik is a B2B conversational AI solution for enterprises that uses a mix of AI, ML and NLP (Natural Language Processing) to build chatbots that can be deployed by companies on websites, apps, and other programs for countless applications. Haptik has reportedly reached a 100 million devices and processed

over three billion conversations. The chatbots are trained to handle several support queries, help drive sales, and even enhance customer experience. In April 2019, the company entered a strategic partnership with Reliance Industries which acquired an 87 percent stake in the company at a deal valued at ₹700 crore. Recently, Haptik also launched a WhatsApp hotline or chatbot that provides accurate information about COVID-19 and dispels myths around it.

Spyne

Gurugram-based, AI-driven SaaS startup, Spyne, offers ecommerce sellers and other platforms full-stack photography and editing solutions. Spyne also provides photographers with a content management platform as well as the opportunity to connect with reputed companies in the field. It connects businesses with photographers who conduct photoshoots

Spyne is an AI-driven platform that helps photographers and businesses

that are registered on the platform. The company has partnered with about 70 studios across India that conduct business photoshoots and are therefore able to fulfill demands of businesses that come to their platform. Once the photographers shoot images requested by businesses, Spyne takes up image processing by leveraging its AI-powered engine. The company claims that its AI engine is capable of processing images at a much faster rate than human editors, with it being able to accomplish hundreds of edits in a matter of minutes. The platform also maintains quality checks and guarantees 99.9 percent accuracy and a 100 percent on-time delivery.
