

Eteria

Funding: US\$ 159,356 pledged of US\$ 58,532 goal

Link: <http://dgit.in/Eteria>

Vitiesy have come up with a new product called Eteria – a filterless personal air purifier that comes equipped with a smart air monitoring and purification system. The purifier's differentiating factor is its compact nature and its washable NanoFilter. Instead of having a large air purifier in every room of your house or office space, Eteria can be taken around the house/office with you. All you need to do is attach the air purifying unit to Eteria's air monitoring sensors. Additionally, the purifier, as stated before, is filterless. This means that the unit comes with one washable NanoFilter that can simply be washed under running water and fixed back into the device. The sensors in Eteria measure parameters such as temperature, humidity and VOCs (Volatile Organic Compounds) in your home. The LEDs on the sensors will let you know the air quality of

the room. The purifying unit attaches to the monitoring sensor module magnetically. The main purifying unit connects to your home Wi-Fi while all the other modules connect to the main one via Bluetooth. You can also control Eteria via the accompanying app and change the fan speed, LED indicators, select custom programs, and much more. Eteria also comes with Amazon Alexa and Google Home support, so you can simply ask Eteria about the air quality in your surroundings. Moreover, Eteria is made out of 100 per cent recycled plastic.

KALEA

Funding: US\$ 280,182 pledged of US\$ 87,799 goal

Link: <http://dgit.in/kalea>

Composts are a great way of disposing of your kitchen waste in a responsive and environment-friendly manner. Kalea makes this even easier. This device is a fully automatic kitchen composter that turns natural organic waste into compost. All within the confines of your home! If you cook at home a lot, you are bound to have heaps of food scraps as well as leftovers that you just dump into your garbage bin. Instead of doing that, Kalea can turn wasteful food scraps and leftovers into nutrient-rich compost in 48 hours. Since you probably throw away kitchen waste every day, you can dump new kitchen waste into the device even when it is currently composting old waste. Moreover, the device emits no odour. All you need to do is fill Kalea with your food scraps. Kalea then begins the shredding and drying process and then once you have filled up enough compostable material, the machine automatically begins processing it in its composting chamber. Using an intelligent control system that manipulates temperature, humidity and aeration, the natural composting process begins within the confines of the chamber. The compost, which will be ready in 48 hours, can be used for indoor plants, in gardens and even fields. Additionally, the company claims that Kalea's compost can be stored for up to two years! The company also states that its compost is rich enough that you only need one part compost with 10 parts soil.

Xtron Pro

Funding: US\$ 29,854 pledged of US\$ 7,582 goal

Link: <http://dgit.in/xtronpro>

The Xtron Pro is a programmable handheld game console that can not only run NES games but also games programmed by you on the MakeCode Arcade platform. Additionally, it's modular nature and the array of sensors it comes with means that it can be transformed into a pretty nifty wearable as well! The Xtron Pro can track your steps and can be worn around your wrist like a typical fitness watch. Its modular design is made possible by four-pin connectors which can

be used to attach extension sensors and other modules to build more interesting applications. The magnetic modular design can be used to switch games from portrait to landscape mode as well. The MakeCode Arcade platform is a code editor platform where you can build retro arcade games

for handheld consoles. Here, you can build games by visual program language, JavaScript or Python, and then run and test them within a simulator. The games can then be downloaded to the Xtron Pro. The device also supports TileCode, designed by Microsoft, which lets users design, code and play games directly on the Xtron Pro. The device comes equipped with 16MB flash memory which lets you store multiple retro-style games. What's more, the device also comes with a built-in IMY sensor which means you can even create motion-sensing games that you can play on this console. You can even connect two or more Xtron Pros together via data cables and play multiplayer games.
