

it all in order to dig deeper and put the product to test. Probe it from all angles, listen to all the opinions about the product from interested parties, but present only our findings as the they are, including our test methodology, and then let our readers make up their minds themselves as to whether the product is good or not based on our findings.

And let's be totally honest, the fake news and pathetic journalism is creeping into our domain as well. You will find thousands of "reviews" online for every product, most of them from smaller blogs and groups. Some of those groups are really good at the niche they target, and do an amazing job, however most of them are just in it to try and get as many freebies as they can from companies. So they

those likely to give them favourable or rave reviews first, which results in them getting more traffic at the time of launch. If it's for a product available in the market, we're able to buy it ourselves and write our unbiased review. But if it is a product that is yet to be released, our access is solely dependent on the company to provide us with the device.

This gives companies the ability to punish those who don't toe their line and praise their products, and of course we cannot complain about it because the reasons given for products not reaching us on time are always something innocent, such as delays in foreign shipments, etc. it would be so much easier to be dishonest and masquerade paid content as reviews, but we'd rather shut down

to sleep. As we know, lack of exercise is something that is terrible for our health, but technology is working hard to make us even lazier.

That said, to be fair, technology can also be used to help us stay fit, what with all of the fitness gadgets and apps that are being pushed into our faces. Of course, using them is another matter altogether, and we end up being back to square one where people just do what they want to anyway.

We've already looked at how our memory and brain power in general is being affected, sometimes for the worse, and we know heart health problems are on the rise, and yet we're being given ways in which to get even less exercise. Almost all of us at Team Digit have been working from home for the past six months, and so have many of you, all thanks to technology. Many of us might not ever need to return to an office full time, because offices cost money and bandwidth is cheap. While on the one hand we have to thank technology for letting us keep our jobs in such tough times, we shouldn't allow the world depicted in the animated movie Wall.E to come true.

There's another way we're being replaced, and that's by our evolution into whatever technology-enabled beings will rule this planet in the future. Thanks to developments in nanotechnology, chips and circuitry are all shrinking constantly, and power requirements falling. If someone figures out how to tap into our natural energy, and to interface the silicon circuitry with the carbon-based networks we run inside ourselves, we're headed towards a reality that's often depicted in sci-fi flicks. At some point we are going to end up not being human anymore (by today's definition), but some hybrid being that is part animal and part machine, built specifically to excel at using technology. If you want to know whether you're a geek or not, ask yourself if you'd like to be turned into that hybrid being. If your answer is an enthusiastic "Yes" riddled with impatience and consternation at your body's current limitations... you're definitely a geek! 📺

Is this the future we are headed towards?

wax eloquent about certain company's products, and are encouraged by said companies by being provided devices on priority.

Meanwhile, certain companies refuse to advertise with us because we happened to tell the truth about their products, which means rating them poorly when they deserve a poor rating. And it's not like this is a shock to anyone, because our rigorous test process is known to all manufacturers before they send us the devices for review.

The problem is, when everyone calls their articles "reviews", and bias is not clearly visible, most readers are not able to tell paid content from actual reviews, and this ends up hurting us in two ways. Manufacturers send their products to bloggers and

this brand before we allow its name to be misused in such a fashion, and thankfully enough of you readers exist, and put faith in us, even in times of fake news and reviews. Thank you from the bottom of our hearts for that!

■ US

When we say 'us', we mean humans as a species, and there are several ways in which we're being ruined or killed off thanks to technology. The most obvious of all is the way we are getting lazier by the minute. More and more jobs are involving us just sitting on our backsides and doing very little moving around. Even if we do move about, it's inside cars where we're sitting, and then to an office where we sit, and then back home where we sit, and eventually lie down
