

DROOLMAAL

LG Signature OLED R

We've seen it all, from transparent TVs to ultra-massive TVs. Now we've got rollable TVs. LG's rollable OLED display was first displayed back in CES 2018 with the USP being that it could roll back into a box. That sure would make carrying a TV around much easier. Not that there are many occasions where you would actually need to carry a TV around. Especially one with a 65-inch display at that. Which is what brings us to the LG Signature OLED R, which is a 65-inch rollable display. This is an 8K display with a refresh rate of 120Hz. On a rollable display mind you. The TV also has an HDMI 2.1 port along with a Variable Refresh Rate or VRR mode, so you should be able to tackle any kind of video quality with ease and smoothness on this bad boy.

Even with those monster specs, it's the unique aesthetic of the LG OLED R that makes it stand out. Simply put, once you're done with the TV, you can just press a button and watch the TV roll right back into its base. Much like a projector screen. The base is made out of aluminum and looks pretty classy, so you don't have to worry about

a random ugly-looking bar of metal in one corner of your house. What's more, the TV comes with more than just the rolled-up and fully-extended modes. There's also a "Line View" mode as LG puts, where basically just the top section of the TV peeks out of the base. In this mode, you can have the TV display a clock, or use it as a music dashboard, or even just for lighting. Pretty cool. Of course, none of this comes cheap, the LG Signature OLED R will set you back by a whopping \$87,000. However, we don't know if LG is planning to release the TV internationally yet.

Porsche Design Acer Book RS

The Porsche Design Acer Book RS, like the name suggests, is the result of a collaboration between Acer and Porsche Design. Going for the sleek and minimalist look, this laptop features a unibody construction, much like the kind seen in MacBooks. It also features carbon fibre parts, with the top of the lid being covered with a carbon fiber panel. This is clearly inspired by top-end supercar bodywork. Shouldn't come as a surprise from Porsche Design.

When the lid is opened, the hinge automatically elevates the notebook by a few degrees, giving it a slight slant. This is pretty common in laptop models, in order to provide an ideal and comfortable typing experience. Additionally, those few degrees off the ground also help run the notebook at cooler temps.

Coming to the specs, we've got an 11th-gen Intel Core i7 CPU, with an optional Nvidia MX350 GPU. You also have the option of an Intel Core

i5-1135G7 processor and Intel Iris X Graphics, which makes the Acer Book RS comparatively affordable. Both options have dual-channel LPDDR4X SDRAM support, with either 8GB or 16GB onboard LPDDR4X system

memory and a choice of either 512GB or 1TB SSD of storage. For the display, we have a 14-inch IPS display with a 16:9 aspect ratio at FHD. The

collaboration between the two companies has also spawned some accessories, including a mousepad, a mouse, a carrying pouch, and the Porsche Design Travelpack RS which is a water repellant carry pack made with Ecco Palermo leather. The mouse is wireless and also has carbon fiber

panels on it, staying on theme. You can get your hands on the Porsche Design Acer Book RS at a starting price of \$1400, going all the way up to \$2000 which includes all the additional accessories.
