Realme Smart Plug

Normally known for their phones, we weren't really expecting any IoT products from Realme, but here we have with us the Realme Smart Plug. Right out of the box, this is a very simple looking plug, which is a good thing. It's got a small blue LED indicator in the middle towards the top. Having a very blingy or flashy smart plug wouldn't really fit too well with most people's home decor. This one will blend in no problems.

So what are the features of this smart plug? Well, we've got remote smart wi-fi control, meaning if you've got the Realme remote app on your phone, you can control this smart plug wirelessly via your smartphone. If that wasn't enough, the Realme Smart

Plug also comes with Google Assistant and Alexa Support, which is great considering that most IoT smart home devices synergise well with these smart assistants.

Thanks to the "smart" nature of these plugs, you can also do

a lot more with them via the app. In addition to the usual perks, such as being able to control whatever is plugged into it remotely, you can also set a charging schedule for these plugs, and for the devices that are plugged into it. For example, set timers for appliances like TVs or Microwaves. This is useful if you're someone who tends to forget turning off appliances at night. In case you forget to turn them off yourself, or even forget to turn them off remotely through the app, you can just schedule the plug itself to do it for you. Timers and scheduling are great features to have on a smart plug in our opinion, and could have several uses.

For the reasons above, we think that the Realme Smart Plug is a great smart plug to pick up, which in addition to a lot of features via its app, can also help you save electricity.

Campark X30 4K Action Camera

Action cameras are synonymous with GoPro and over the years we've seen several brands copy the same look and feel of GoPro action cameras but the original GoPros have always retained their edge over the competition. However, GoPro cameras aren't cheap even though there have only been incremental improvements to the product. As a result, the other brands have slowly inched ahead and established themselves as noteworthy competitors. The Campark X30 4K Action Camera is one such candidate.

It shoots at 3200x1800 resolution at 60 FPS which isn't exactly 4K UHD or 4K DCI but it does come really close. You can also shoot at 4K 30FPS, 2.7K 30FPS, 1080p 120FPS, 720p 240FPS and going all the way down to 720p 30FPS. The camera gives you the option to pick from H.264 and H.265 and uses the MP4 container. There is a MicroUSB and HDMI port on one side while on the bottom you have the standard 1/4-20 UNC thread hole for mounting the camera on your typical tripod.

Design wise it's practically a GoPro camera. Everything from the button placements to the lens and the size are similar to the GoPro. We'd say that it's a little more compact than the GoPro Hero 7. The rear of the camera has a 2-inch LCD touchscreen digital viewfinder and accepts MicroSD cards for storage. The Campark X30 comes with plenty of mounting accessories in the box unlike the GoPro where you have to procure most of them. You also get two batteries with the X30.

The quality of the footage is pretty good. There's a slight bluish tinge to videos which is very apparent indoors but not so much outdoors. The X30 has electronic image stabilisation but it does not match up to the GoPro. However, if you have a gimbal, then the Campark X30 becomes a good action camera. Considering that the Campark X30 only costs less than one quarter of what the GoPro goes for, we couldn't complain.
