The OxygenOS experience

In conversation with **Sam Twist**, Senior Product Manager at OnePlus, find out how mobile phone users have evolved over the years, how the company ensures the same premium experience across its now extended family, and more.

Siddharth Chauhan |

d As per the CMR survey, OS is an integral part for users when making a smartphone purchase with as many as 55 percent users considering it a “very important” part of the deciding factor. Do you think that the end-consumer has, over the years, become more aware of what they want from an OS as opposed to back in 2015 when OxygenOS debuted?

Sam: In addition to an increased sense of awareness about the overall industry and its diverse offerings, the end-consumer is now more empowered to communicate their needs and settle for nothing less than that. Customers are now beginning to acknowledge the drastic impact

and transformation a well-balanced OS brings to their user-experience and now consider it a principal factor while making a purchase decision.

In order to consistently evolve with the industry and satisfy every need of our consumers, OnePlus has always aimed to deliver on the promise of a burdenless experience and optimize and personalize every individual user’s interaction with our offerings. Our advantage simply lies in having an enthusiastic and vocal community who are ever ready to challenge us, laud us for what they are appeased with, while condemning features that are not useful to them, to help build our brand, offerings and operating systems. This is extremely important to us because they help us gather feedback almost instantaneously. Hence, with the help of this

open channel of valuable feedback, we have been able to further understand the needs of our users and create an OS that is fast, lightweight, highly customizable with a clean user interface paired with simple aesthetics which can be seamlessly adapted to by our community.

d What did OnePlus do differently than all the other mobile operating systems out there?

Sam: What OnePlus did differently, was make a promise to its consumers to never settle and honour this to the best of our abilities. With assembling and addressing community feedback being at the core of our product development strategy and overall brand philosophy, we have been able to consistently bring industry-first innovations to consumers which have been greatly appreciated by our community at large. In line with this commitment, our aim has always been to make every individual interaction with our offering burdenless and personalized. For instance, when it comes to stock Android, we are committed to the essence of stock rather than how it looks and feels.

While we want to retain every aspect of Stock that is meaningful to our community of users, we want to move away from the redundant features. By definition, stock means a fast, smooth and intuitive experience which effortlessly integrates itself into the lives of our users, without any bloatware. OxygenOS11 has been designed to provide our users with a fluid and responsive OS, high refresh rates, AI smarts, and customizable optimizations rather than focus solely on aesthetics which is primarily what was being asked from us through our forum and other platforms of feedback.

In the survey, over 33% of respondents faced challenges with battery drain and the need to free up memory while 26% and 25% of users were unhappy with unwanted advertisements and bloatware.

d How does OnePlus tackle battery optimisations for different use cases?

Sam: OnePlus has a robust battery optimization feature that is integrated
