Hello,

It's been a long time since I wrote a feedback to you. This time also I thought of writing in September but finally got a chance in November.

So in August I saw this FastTrack - "How to become a better developer". Being a tester it came in mind that why you did not write - "How to become a better tester". Voila and I received the September month FastTrack and I was happy my wish get fulfilled and I decided this time I should definitely complete every page of it.

That happiness was short-lived when I read half of it. Did it get a thorough review from any of the industry people or even internally?

The images taken were good as they were taken from some online sites which gives 'OK' information.

Page 27 - Top ten manual testing tools - Selenium is mentioned,

It's not a manual testing tool. Also all various kinds of tools are mixed and added here.

Page 28 - Top ten blackbox testing tools

Blackbox is functional testing, but I see JMeter and loadrunner are mentioned which are for performance testing and their description is also like that they are for non-functional tests. So how can they be in this category?

Page 30 - Junit is under white box testing tools

Description says that it can be used for development. If its testing section you should mention how it can help in testing.

Page 31 - Top ten grey box

Now Selenium is grey box as well and postman is also mentioned. Neither of these tools allows you to look at system code, how can we do that?

Page 40 - 2 types of testing

"Maintenance testing is about having the same quality throughout the life cycle of the program"

First of all there is nothing called maintenance testing, even if there is somewhere it exists the above line does not mean anything. What's the same quality?

Page 41 - "Software test suites are much more reliable and error free than manual testing."

**** Shortended ****

I know you guys take this seriously. it's just for improvement i have spent half an hour writing this letter, being a reader for many years now (need to check with you guys)

There are good things you do that kept me with you for so many years. So nothing to worry, will try to share feedback for this month as well.

Not sure if this letter will find a place in next edition or not, but please do reply after going through things. Some of them might not be right but more than 70% should be my confidence says that (the things I reported)

Happy Belated Diwali

Regards

Gaurav khurana

Hey Gaurav,

Quite frankly, I was expecting such a letter and I'm quite overjoyed by the fact that you took the time to actually go through the FastTrack and provide such detailed feedback. Having gone through your letter, I certainly agree that we should have had an industry professional have a look to ensure the veracity of the information in the book and work on the messaging. However, it also seems that we'd be debating semantics here. Let me explain with a few examples.

You are correct about Selenium being an automated testing tool but think of Selenium as a motorised screwdriver. You can drive a screw manually using a screwdriver or use a motorised screwdriver. Either way, it's up to the professional to decide how to use it. We're merely putting out the information that it can be used either way. Similarly, in the case of JMeter, you could use it to, say test if API calls are being properly handled by a function. In this case, you are performing functional testing wherein you need to know how the function will respond to different API calls. Does that mean JMeter is the best solution? Not at all, but if you don't have the resources to procure an expensive testing tool, then open-source alternatives such as JMeter can be put to use in a creative manner as explained.

Most of the feedback you've given us is very much valid and I must apologise for letting these things get into the magazine. The next time we revisit the topic of testing, I'll reach out to you for vetting the content. I hope you'll be equally helpful with feedback then as you have been this time.

-Mithun
