Best features in iOS 14

Some of the best features in Apple's most ambitious mobile OS update in years

H

aving launched what may quite possibly be one of the largest visual overhauls

Apple has made to its mobile operating system in years, iOS 14 surely has managed to turn eyeballs. While the company has still managed to retain a sense of familiarity with the new update, there are, in fact, a plethora of new features sprinkled across the OS for users to take advantage of. Of course, you may already know the headlining features

that have made their way to iOS 14 such as widgets and an app drawer, which were long overdue, however, the update also includes some less obvious feature additions.

The update has been out for a few months now and users have already begun testing the waters with the refreshing new set of features. While everything hasn't been quite rosy so far, with some battery issues and buggy widgets souring the experience, future tweaks and updates should improve the OS. Meanwhile, here are some of the best features in iOS 14 that you should definitely check out.

QUICK ACCESS 'BACK TAP' COMMANDS

This nifty little accessibility feature allows you to set up actions corresponding to the number of taps on the back of your iPhone. You could customise this as per your liking to perform actions such as waking up

Siri, taking a screenshot, changing the volume, locking your phone's screen and others. In order to set up back taps on your iPhone, head over to Settings > Accessibility > Touch > Back Tap, and you can now set up specific commands for double and triple taps.

SELFIE MIRRORING

Before the iOS 14 update, selfies taken from iPhones using the stock camera app would flip or mirror the image by default, which can be a bit jarring since it tends to look quite
