

GoDaddy Security Issues

GoDaddy employees accidentally helped hackers mess with crypto sites - Liquid and NiceHash. <https://digit.in/dec20-75>

Twitter Hires Mudge

Twitter has appointed veteran hacker - Peiter Zatko (Mudge) as their new head of security. <https://digit.in/dec20-76>

different from what you see in the viewfinder. Fortunately, in iOS 14, Apple allows users to change the default behaviour in this respect meaning you can actually set the camera app to show selfies

as they were taken. In order to do this, navigate to Settings > Camera and now toggle the Mirror Front Camera option off. It's as simple as that!

FAKE EYE CONTACT ON FACETIME

iOS 14 is host to some new FaceTime features, some of which were delayed from iOS 13's beta version.

One such example is Fake Eye Contact in FaceTime. Your iPhone is now capable of making it appear as though your eyes were looking directly into the camera, even if you're staring at the screen instead. It's a simple feature but it can be useful when you're on a work/school call and trying to multitask on your phone at the same time. You can turn this subtle, yet effective feature on by heading over to Settings > FaceTime > Eye Contact.

NEW PRIVACY FEATURES

There are some new features in iOS 14 to bolster user privacy. The first

one is camera and microphone warnings which are basically indicated by a green dot (for the camera) and an orange dot (for microphone) which appears next to the Wi-Fi icon on the top right of the screen. This lets users know explicitly that the app they are using currently is using the camera or the microphone in the background. You can also now restrict apps from using your precise location and instead give the apps access to your approximate location. Lastly, iOS 14 will also warn you if an app has accessed your clipboard data.

SMART STACKING WIDGETS

Most of you must already know that iOS 14 now allows users to use widgets across the home screens. However, the new OS also comes equipped with a feature called smart stack which allows users to combine or stack multiple widgets on top of each other. iOS 14 then learns, over time, to automatically switch between these widgets based on your usage,

location, and the time of the day. It's pretty neat, however, it does take some time to learn your behaviour.

ENHANCE YOUR VOICE RECORDINGS

The Voice Memos app which is used for recording just got a new upgrade

with iOS 14. The app now has an Enhanced Recording option which helps reduce background noise and make your recording sound cleaner. All you need to do is record a voice memo, then click on the ellipsis (three-dot) menu and select Edit Recording. Now, click the magic wand icon and then click Done. You can even organise voice memos into folders now and mark your favourites for easy and quick access.

NEW IMESSAGE FEATURES

Do you have a few favourites you text frequently on iMessage? iOS 14 now allows users to pin up to nine contacts that appear at the top of iMes-

sage for users to quickly access. To do this, simply click the three-dots menu at the top of iMessage and select Edit Pins. Now, just click the yellow pin icon next to the contact or group your text frequently. iMessage also lets you use mentions in Messages conversation. To do this, type a contact's name and then tap the name that appears in a list. Or simply type @ followed by the person's name. Lastly, you can also reply directly to a specific message in a group, giving you an inline mini thread to follow. This is especially useful in large groups where your message can get lost in the chaos. To do this, press and hold the message you want to reply to and then click on Reply. Type your reply to the message and send it. The reply is not private, however, a mini thread appears at the bottom that you can now easily follow.
