Best features in Android 11

The stable Android 11 update is here for select devices. Here are the features you should check out

Dhriti Datta | dhriti@digit.in

The 2020 iteration of the Android OS, dubbed Android 11 (R.I.P. quirky dessert names) was released

on September 8. Starting off, Google Pixel devices were first in line to get the coveted update while it almost instantaneously trickled down to devices from other manufacturers such as OnePlus, Realme, Xiaomi, and Oppo. However, devices from

other companies such as OnePlus, Samsung, and others that are touted to get the update, haven't received it yet, but the companies have, at least, shared a rough roadmap to Android 11 for eligible devices.

Android 11 wasn't a massive overhaul over its predecessor, however, the update did bring with it some interesting and nifty changes and additional features. If you're amongst the lucky few to already have Android 11, or if your device will be receiving the update soon, there are some features you should definitely check out. Let's kick off delving into some of the best new features inculcated into Android 11.

IMPROVED MEDIA CONTROLS

Android 11 has moved media playback controls from the notification panel to a permanent spot in the Quick Settings panel. This means,

hitting 'Clear All' on your notifications should no longer dismiss your media playback controls even if the music is paused, allowing you quick access to them whenever needed without having to open the media player back up. Additionally, if you are using more than one media player at the same time, you can actually cycle through their control panels by swiping right and left, which is extremely convenient. Not only that, the look itself is much cleaner on the whole.

The media playback controls panel also allows users to choose what device should play the music/media. This is especially handy in cases where you have, say a Bluetooth speaker and a pair of headphones, connected to your phone at all times. Now, you can click on the icon on the top right of the media player panel and choose which device the music is played on.

SCREEN RECORDING

While it has been possible to record the screen on Android devices with the help of third-party apps for years now, Android 11 has finally brought native screen recording to devices with the latest OS update. This also means you can finally access your device's internal audio, without having to root or via other methods.
