

Android Apps on Windows 10

Reports suggest that Microsoft could be adding support for Android applications on Windows 10. <https://digit.in/dec20-79>

So, whether you want to record your gameplay for your YouTube channel or if you simply want to show your grandparent's how to use an app, you can easily do that with Android 11's native screen recording. All you need to do is swipe down the notification tray and find the Screen Record icon in Quick Settings. If you can't find it, you may need to add it to your Quick Settings panel from a list of available icons. Next, just tap the screen record tile to start recording. You can choose to record audio via your phone's microphone, use device audio, or simply turn audio off. To stop the recording, simply swipe down the notification tray and tap the Screen Record notification to turn it off. You can now view, edit, share or delete your screen recording.

POWER BUTTON MENU

For years now, we've been acclimated to a really simple and minimalistic power off menu which is triggered by long-pressing the power button on most phones. The screen usually comprised of options to power off, restart, go into emergency mode, or simply turn off the screen. In Android 11, the power menu has gotten a serious visual and functional

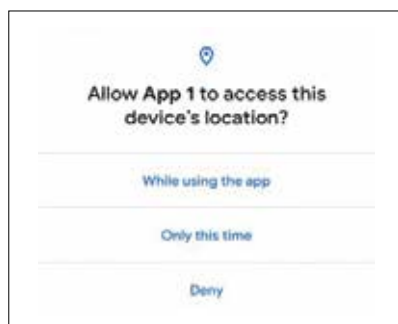

overhaul. Not only can you power off or restart your phone from here, but you can also access your default Google Pay debit or credit card. Google Pay recently introduced the NFC-based tap and pay feature for Android users in India and even partnered with Visa and other banking partners to bring this feature out. This feature on Android 11 could be pretty useful if we see the proliferation of NFC-based payments in India.

Apart from the addition of this, the power menu is also home to shortcuts to any smart home controls you may have set up via the Google Home app. So, say you have set up smart lights and thermostats via Google Home, you will be able to control them with merely a tap from this menu. Also, if you tap on the triple dots on the right side of the tiles, you can also customise these smart controls right from the power menu.

GRANTING APPS TEMPORARY PERMISSIONS

For those with lingering security concerns, Android 11 now allows you to grant temporary permissions to apps instead of permanent ones. Some

apps require access to certain components of your device to function, such as the microphone, camera, GPS, and other sensors. Now, when apps ask for permission, Android 11 users will be presented with the option to grant them these permissions "Only this time". Even better, if you have apps that you haven't used in a while but are still installed on your phone, their permissions are automatically revoked over a set period of inactivity. You need to opt in to use this feature. You can do this by pressing and holding an app's icon. Then, tap the info symbol (the i symbol) and tap on Permissions. Now, turn on the toggle to 'Remove Permissions if the app isn't used'.

NOTIFICATION HISTORY

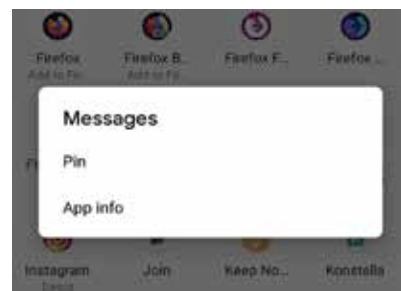

We've all, at some point or the other, faced this issue. You get a notification and you instinctively swipe it away

only to realise later that it could have been a notification you don't want to miss. Well, it's too late by then and the notification is gone. Android 11 has changed that. A new feature allows users to save every single notification that has come through within the last 24 hours. All you need to do is check the list and find the important notification you missed. This is, however, not turned on by default. So, in order to turn it on, you need to head over to Settings > Apps & notifications > Notifications > Notification History. Now, simply toggle the feature on. Once it's on, you can view the history in the same place.

PIN APPS IN THE SHARE MENU

Finding the app you want in the Android share menu can be a hassle at times. If you often share screenshots, images, website links, and more to particular apps, you can simply pin these frequently used

apps to the top in the Share Menu in Android 11. In the main Android share menu, simply tap on an app in the Apps List and then pin it to the top. However, this doesn't work with apps that use custom share menus such as Google Photos.
