Spotify Codes

Here's how Spotify's QR-code like song/playlist/artist sharing system works. <https://dgit.in/dec20-66>

<summary> and <time>. These elements define all the sections of a website and when you use an accessibility tool such as a Narrator or a Screen Reader for blind individuals, the tool then uses these elements to help the user navigate the website.

Having semantic elements but not following a logical order to the website is also tantamount to a crime against disabled individuals since that would lead to confusion. Always,

tanomaly and Tritanopia are the different types of colour blindness that humans could be experiencing. About one in twelve males or one in two hundred females experience some form of colour blindness and this is perhaps one of the simplest accessibility concerns that you can implement on your website. There are several simulators for developers to run their websites on to see how individuals affected by colour

additional layers of elements to help the colour blind.

Let us take for example a URL that is present on your website. The default blue colour that we see for URLs on websites was chosen because it is visible to all forms of colour blindness. If you wish to pick another colour for URLs that have not been visited (blue) and have been visited (purple), then these simulators would help. Similarly, if you have a full-page advertisement or pop-up opening on your website then please ensure that the button to close or exit the screen is clearly visible and that the colours used are such that even the colour blind can easily find it. Certain browsers have such tools inbuilt. Chromium and its derivatives such as Google Chrome, Microsoft Edge and Chrome have the inbuilt "Dev Tools" which include an accessibility feature that can simulate how a website would be viewed by those affected by colour blindness.

Pick your colours wisely

outline the website and think about how a user would want to navigate the website rather than trying to force users to navigate the website how you would want them to.

COLOUR BLINDNESS

Deuteranomaly, Protanomaly, Protanopia, Deuteranopia, Tri-

blindness would experience their websites. It is not just a matter of choosing the right colours but also about incorporating a few additional elements so that a contrast in colour is achieved. A lot of brands and services have their own colours which they would not want to compromise on, so they'd want to incorporate

BLURRED VISION

Another common problem that a vast majority of us experience is blurry vision. Whether it is far-sightedness or a degenerative age-related disorder, there are multiple disorders which lead to blurred vision. If you are using ridiculously
