iPhone 12

The iPhone of choice for 2020

The iPhone 12, in our opinion, is the most value for money iPhone from the 12-series lineup, but we'll get into that at the end of this review. For now, let's examine what you get, what works, and what Apple could have done better.

Build, design and display

The iPhone 12 adopts a design that's an evolution of the original iPhone 5. The flat edges make the phone easier to grip thanks to the increased surface area. And additional bonus with the iPhone 12 is that it too uses the Ceramic Shield glass just like the Pro variants, making it more resilient to drops. The iPhone 12 continues to come with an IP68 rating, offering water and dust resistance.

Where things get interesting is with the introduction of MagSafe. Apple has placed magnets into the back of the iPhone in a circular pattern, to aid with error-free wireless charging. You can also use a variety of magnetic add-ons such as wallets, and cases that go with the MagSafe. Pretty neat.

The 6.1-inch XDR OLED panel on the iPhone 12 is perhaps the biggest upgrade to the non-Pro model. There was a lot of hope for a high refresh rate display, but the iPhone 12's display is still set to 60Hz. The display has a peak brightness of roughly 615 nits, which makes it adequately bright to use in bright daylight.

Performance and battery life

The Apple A14 Bionic shifts to the 5nm process this year, and every time the node shrinks, we see improvements to performance and battery life. Couple that with Apple's extreme control over iOS, you can expect butter smooth performance for whatever it is you do.

When it comes to synthetic benchmarks, the iPhone 12 showed some very interesting behaviour. While the iPhone 12 pulls ahead of the Android competition by a notable margin, it

fell behind last year's iPhone 11 Pro when it comes to some sheer numbers.

Coming to battery life, the iPhone 12 has a rather small 2850mAh battery. It also charges slower than most smartphones out there, supporting just 20W over the cable and 15W over wireless. On our offline video loop test, the phone lasted a little over seven hours, an admirable number, for sure. Each round of CoD Mobile's team deathmatch eats up anywhere between 5-8 percent battery life as well.

Camera performance

Apple has improved on their Image Signal Processing pipeline, their Smart HDR algorithm, and of course, Deep Fusion, with the iPhone 12. In terms of specs, there's a 12MP primary camera with a 7-element lens and an aperture of f/1.6, a 12MP ultra-wide camera with a 13mm lens sporting an aperture of f/2.4, and finally a 12MP front-facing camera which has an aperture of f/2.2.

The day time shots from both the primary and ultra-wide camera now finally look a near-identical in terms of their colour attributes. In indoor lighting conditions, once again, the

two cameras perform admirably well. Lastly, we've got the low light performance. The iPhone 12 takes stellar low light photos, the ultra-wide lens does exhibit visible vignetting around the edges, along with a loss in sharpness in the same areas.

Where the Apple iPhone 12 really excels past every single smartphone in the market is the fact that it is capable of shoot 4K video at 30fps in Dolby Vision HDR. You get Dolby Vision HDR video out of all three cameras. As far as dynamic range and colour go, there is no competing with the output of the iPhone 12, however, there is a catch. You can enjoy the Dolby Vision content only on an iPhone or a device that's Dolby Vision capable. If you try to upload the video to Instagram or Facebook, you're going to get brightness and colours that are completely off. That's because the apps have not yet been updated to handle the Dolby Vision HDR content from the iPhone 12. The best workaround, for now, is to disable shooting in HDR, which thankfully, is an option.

Verdict

The Apple iPhone 12 is the most significant upgrade from a previous generation device. This time around, Apple's decided to throw in all the right features, eliminating the feeling that was a phone that "cut corners." You get the stellar A14 chip, a gorgeous OLED display, and a stellar dual camera system that can take gorgeous images and videos.

—Swapnil Mathur

SPECIFICATIONS

PROCESSOR: Apple A14 Bionic (5nm) | GPU: Apple GPU (4-core graphics) | STORAGE: 64, 128 and 256 GB | RAM: 4GB | WEIGHT: 162 grams | REAR CAMERA: 12 MP wide + 12 MP ultra wide | FRONT CAMERA: 12 MP | VIDEO: 4K@24/30/60fps, 1080p@30/60/120/240fps, HDR, Dolby Vision HDR (up to 30fps) | DISPLAY: 6.1 inches Super Retina XDR OLED | IP RATING: IP68 dust/water resistant (up to 6m for 30 mins) | OS: iOS 14.1, upgradable to iOS 14.2 | BATTERY: Li-Ion 2815 mAh, Fast charging 20W, Qi magnetic fast wireless charging 15W
