

Command your file system

Multi Commander is a faster way of working with your files

Aditya Madanapalle | aditya@digit.in

In theory, way Windows expects you to work with multiple folders is to press Windows+R then type in explorer, press enter, press windows+right at the same time, hit Windows+R again, press enter (as explorer is already typed in), press windows+left at the same time, and then begin working with your files, by alt+tabbing between the two explorer windows. Get the timing of the arrows or Windows key wrong, and you can trigger the start menu or the desktop panel. Also it is easy to go wrong during the Alt Tabbing, which throws up this big distracting panel.

LOOK N FEEL

One of the most important things about Multi Commander is how u use the keyboard shortcuts. Now the thing is, you might be used to explorer shortcuts, and these are very different. For example, in Explorer F5 is for refresh, while in Commander F2

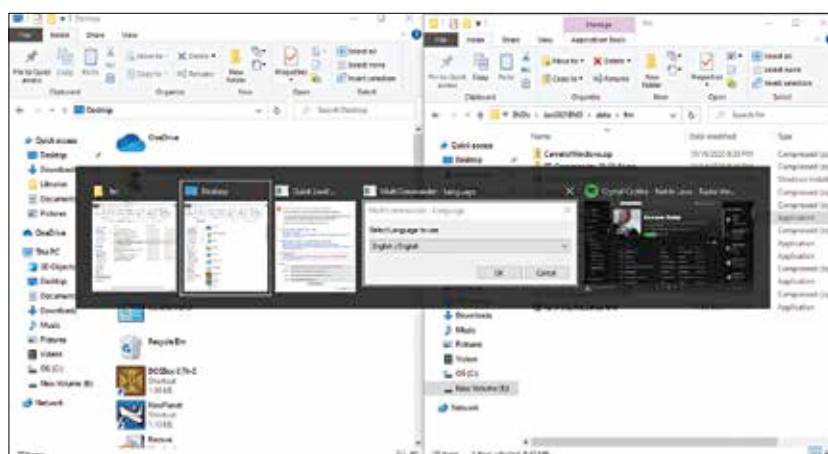

is for refresh. During setup itself, Multi Commander gives you multiple ways of setting this up. You can either use the Commander UI or the Explorer UI, with the appropriate shortcuts. It is also possible to use the Commander interface with Explorer keyboard shortcuts, or if for some bizarre reason you want to do so, the Explorer interface with Commander shortcuts. If there are only a few shortcuts that you use regularly in

Explorer, then go ahead and just install the Commander version, because you can change the specific shortcut and what it does later on.

We will be making just two changes to Multi Commander, because we don't need a single key shortcut for copying. F2 is going to be changed from refresh to rename, and F5 is going to be changed from copy to refresh.

To do this, go to Refresh and change it to F5. At this point it will prompt you to

It is easy to take a wrong step in Explorer
