The Kirin 990-powered Huawei notebook features an 8GB RAM, 512GB SSD and a 14-inch display. <http://dgit.in/jan21-84>

Teardown: Huawei Mate 40 Pro

The spec-monster

Dhriti Datta | dhriti@digit.in

A chore to pry open

The Huawei Mate 40 Pro proves to be particularly unyielding when it comes to prying the device open. The adhesive that holds the device together is extremely strong, and the usual procedure of using heat and suction doesn't work too well. Instead, you have to go through this process to open up a tiny gap between the rear glass and midframe to get an opening tool into, such as the iMac Opening Wheel, which is quite a chore and not good news for repairs.

Hurray modularity!

On the other hand, the Huawei Mate 40 Pro does sport a fair amount of modular components, which spells good news for repairs. These include the flash sensor assembly, all the cameras, and a few more cables. The rear cameras include a 50MP Sony IMX700Y primary sensor, a 12MP telephoto sensor with 5x optical zoom and OIS, and a 20MP ultrawide sensor. The periscope camera gets its very own housing in this device, which means it can be replaced on its own!

The dual-selfie cam

In the process of freeing the silicone, you will also stumble on the dual-sensor cam which features a 13MP Sony IMX688 sensor and a 2MP Time of Flight (ToF) sensor. The selfie camera is, surprisingly, an ultrawide one which means both front and rear cameras have up to 100-degree fields of view. The Huawei Mate 40 Pro can also shoot 4K HDR video with the front 13MP sensor.
