Workflow visualiser

Dependency Review

progress of a workflow in real time and makes it easier for new users to understand complex workflows as well as identify problem areas. Troubleshooting becomes monumentally simpler with the new visualiser and deployment logs feature.

DEPENDENCY REVIEW

We all use third-party packages and repositories in our own projects. Often, we leave it up to the maintainers of those third-party packages to handle any and all vulnerabilities and bugs pertaining to their packages. Sometimes, it pays to receive security alerts for recently discovered vulnerabilities with any of your dependencies.

In its current form, Dependency Review helps users understand changes to the dependency workflow and what all security impacts that might come out of each pull request. It lists all the dependency changes introduced with a pull request and shows you which all files were changed and what was added, updated or removed along with time stamps. It even links all the other projects that utilise that particular module and gives you a vulnerability overview.

GITHUB ENTERPRISE SERVER 3.0

Enterprise Server 3.0 is more tuned for continuous integration and continuous delivery (CI/CD) and adds automation capabilities to GitHub Actions and Packages. Important aspects such as code reviews, environment secret scanning, etc. can be integrated into the workflow when deploying the new server. Server 3.0 also supports GitHub for mobile which is a much welcome feature in the work from home era. Server 3.0 will also introduce secret scanning to look for hard-coded credentials in your code. GitHub has been using secret scanning on more than 50,000 private repositories and has performed more than two million scans and is pretty robust at hunting down hard coded credentials.
