

Bird Buddy

Funding: US\$ 3,226,701 pledged of US\$ 61,205 goal

Link: <http://dgit.in/BirdBuddy>

The Bird Buddy is a smart bird feeder that notifies you when your feathered friends visit you, captures their pictures and even organises the images so that they can be easily shared across social platforms. Not only that, Bird Buddy is also equipped to recognise a wide range of birds species (approximately 1000 bird species) and will notify you accordingly. The accompanying app even gamifies this aspect by giving you an achievement every time you unlock new species of birds, which encourages you to build the ultimate bird collection. The Bird Buddy can identify that a bird has arrived at the feeder via the inbuilt camera, and microphone, that can hear a bird's chirps. You can easily refill the Bird Buddy with seeds or grains for your feathered friends. The clear container in the Bird Buddy can hold up to 3.8 cups of food. The camera can output 5 MP photos and even record 720p live video with a 120-degree field-of-view. The device can also be connected to your Wi-Fi, so that you receive timely notifications whenever the device detects a bird. Bird Buddy is currently on Kickstarter for \$219 with deliveries set to commence around September 2021, and the standalone app is available for \$24. In addition to the feeder, there are a variety of accessories, including a fence mount and wall mount that are also available.

GOOVIS LITE

Funding: US\$ 385,309 pledged of US\$ 9,996 goal

Link: <http://dgit.in/GoovisLite>

GOOVIS LITE is a wearable personal 3D cinema headset with a 2K display with 53 PPD and 4523 PPI that provides distortion-free viewing. Powered by the True 3D Dual M-OLED display, the headset shows a 600-inch virtual screen with a 42-degree field of view. The device can be plugged into a smartphone, tablet, gaming console or PC via an HDMI cable to enjoy content on a large immersive screen. It also supports the latest protocols such as DLAN, Miracast, Airplay, and EZMira. You can also plug the device into the GOOVIS Wireless Cast to wirelessly consume content on smartphones, tablets and laptops. The GOOVIS LITE comes packing an inbuilt cooling airflow system and has a 2,000,000:1 contrast ratio for a vivid visual experience. The headset is allegedly half the weight of the Oculus Quest 2, weighing a mere 200g, therefore users can wear it even for extended periods of time without feeling overbearing exhaustion. The device also comes equipped with customised diopter adjustable lenses with a display accuracy of $\pm 0.33D$ that eliminates the possibility of feeling dizzy or seeing double when using the device. The screen has a distortion rate of less than 1.5 per cent, so the slightest of detail appears clear on the screen. This relatively diminutive product is extremely appealing, especially for people who love consuming content on large screens.

EyeQue VisionCheck 2

Funding: US\$ 75,617 pledged of US\$ 30,000 goal

Link: <http://dgit.in/EyeQue>

Wouldn't it be convenient if you could get your vision checked from the comfort of your home? The EyeQue VisionCheck 2 allows you to do just that. It is a refraction device for consumers to test their own vision, by simply using the device and their smartphone! It is essentially a light-weight optical smartphone attachment that utilises MIT-patented technology

to measure your refractive error and provide you with your lens power. The technology has been extensively tested, as per the company, and uses a variant of the inverse Shack-Hartmann optical method. The fact that it is smartphone-

powered means that most people will be able to use it. The EyeQue performs a self refraction test via the device and smartphone app and the company's proprietary algorithms then process, personalise and store individual results. All you need to do is, download the app and sign up, slip your smartphone into the mount of the VisionCheck 2 and follow the on-screen instructions to start a test. VisionCheck 2 also includes the PDCheck pupillary distance measurement tool, which allows you to quickly and accurately capture your PD (pupillary distance). Once you have both your lens power and pupillary distance, you can order your glasses online.
