

Apple AirPods Max

There were rumours that it was in the works, and now it has finally been revealed.

Apple's over-ear headphones, the AirPods Max. These are the first over-ear headphones for Apple's AirPods brand and it joins the AirPods and AirPods Pro for the 2020 lineup. The AirPods Max has all the features one would normally find on the AirPods Pro, such as simple setup and connections, ANC, and ambient modes. The AirPods Max are powered by Apple's H1 chip with 10 audio cores and have 40mm dynamic drivers housed inside the cups. There are 8 microphones on the device, with six facing outward and two facing inward. The inward facing mics are used for the Adaptive EQ feature present on the AirPods Max. This basically allows it to adjust sound based on the fit of the headphones. The outward

facing mics are used for the ANC and Ambient mode functions. The device also has a gyroscope and accelerometer; 5.1, 7.1, and Dolby Atmos. The AirPods Max also features a dial like the one on the Apple Watch, which can be used to adjust the volume and skip tracks. In terms of looks, it's safe to say there's

nothing else in the market quite like it, and it's definitely a striking looking pair of headphones. Another interesting thing is that there's no Apple logo to be seen anywhere on the AirPods Max. The Max will come in multiple colours including silver, space gray, sky blue, pink and green at a price of \$549.

Nendo folding smartphone

Oppo and design studio Nendo have come together to create a very interesting concept slide-phone. What makes it interesting is the fact that unfolds into three different sizes, with each size serving a different purpose. Making it arguably the most multi-purpose phone yet.

From the fully folded position, the first unfolded segment opens up into a clock and notifications bar. Open it further and you enter selfie mode. The final unfold leaves you with a widescreen display, where you can game or watch shows or whatever it is you do. Another interesting thing to note is the fact that the side buttons behave differently for each size or

stage of unfoldedness, if you will. Also, the phone comes with its own stylus, which they've somehow managed to fit in there as well. When the phone is fully folded, its dimensions are similar to that of a credit card. The first unfold reveals a 40mm screen, which is where you would see the clock and notifications. The second unfold, or selfie mode, features an 80mm display, and the final unfold reveals a 7-inch display. Placed horizontally, you have options to convert the sides of the screens into operating panels with touchscreen buttons. Very handy if you like gaming on mobile and hate the touch controls coming in the way. As for charging, it charges wirelessly on a charging base. The base is like a cube with a cutout in the middle to slot the phone into. The phone is still a concept for now but the tech is there and opens up a lot of possibilities for smartphones, allowing for use in bent and partially bent positions for foldable displays.
