

a life saver. What the multiple cursor allows you to do is edit many lines simultaneously, which are useful when working with lists and tables. To add another cursor to the one that you are using simply hold Ctrl while clicking at the appropriate location. A click without the Ctrl key pressed reverts all the cursors to one. Note that the app lives in the system tray, and you need to shut it down from there once you are done with the work.

TYPORA

Typora is a pretty unique experience when it comes to markdown editors. To start with, it is a WYSIWYG editor. You do not need to use, understand or learn Markdown to use Typora. Since most of the target platforms already have an integrated editor, what is the point of using Typora? Well, there are a bunch of really cool features that make it an excellent tool for writing in general and for the web in particular. The first thing is that it is a really minimal interface, with no distracting elements. It might look pretty basic, but you can create all kinds of content on it including tables, flowcharts, the equations needed for research papers, and good old blog posts. There are easy to learn shortcut keys for every single menu option available, that lets you access all the functions without having to use the mouse.

Then, comes the most important feature that makes Typora so useful, it can be used entirely offline. If you are travelling, or out on a camping trip, and still want to put in some time into writing on your laptop, and have spotty or no access to the internet, then Typora is one of the few software out there that allows you to write comfortably offline, while still being able to see how it

Building the eDVD page in Markdownify

Focus mode and Typewriter mode active at once in Typora.

would appear when it does goes online. Wordpress supports Markdown, so Typora can act as a WYSIWYG client for Wordpress if needed.

This is a software made for writers. The two next Important features to use are the Focus Mode and the Typewriter mode. The focus mode highlights only the paragraph of text that you are working on, greying out the rest of the text on the page. This is incredibly useful for writing long articles, and we wonder why such a feature is not there in other CMS software and word processors.

Then there is the Typewriter mode, which gives a persistent ribbon on the screen, whenever you hit the Return key, the entire page scrolls up by a line leaving the cursor where it is, instead of the cursor hopping to the next line. This typewriter mode makes you appreciate the focus that those using typewriters had as compared to those using word processors and looking at walls of text at a time. Typora does a very good job of making you focus on the individual letters, words, lines and paragraphs, and helps improve the quality of the whole.
