

world, Google Lens can also be used to extract and process text from already existing images on your phone and even screenshots. This is especially useful in situations where the text you want to copy actually can't be copied, either due to the website's policies or if it is in the form of a .jpg that is attached in an email. You just need to screenshot this text and then open up Google Lens. Now, click on the photo icon on the bottom left of the screen, right next to the shutter button. Next, open the image and select the text as needed. From here, you can copy the text, send it to your PC, and have Google Lens read it out loud and more.

CREATE A CALENDAR EVENT

If you see anything with a date involved such as a flyer,

appointment card, save the date, or more, you can save yourself the trouble of manually entering it into your digital calendar and just allow Google Lens to do it for you. In order to do this, open up Google Lens, point the camera at the paper with the date on it, and click the shutter button. Now, tap on the date and Google Lens should give you an option to 'Create a new calendar event'. Select it and the information will be beamed over to your calendar app. You can now tweak it and save it.

**SAVE OR INTERACT
WITH CONTACT
INFORMATION FROM A
CARD**

If someone hands over their business card to you and you want to save the contact information on the card, you can head over to Google Lens to save all the information without having to manually type it all out. Open Lens, point your phone's camera at the card and tap on the person's name. Google Lens should recognise that this is a business card and it will prompt you to 'Add a contact'. Click on it and Google Lens should have pulled all the relevant information from the card into the new contact. Now, just save the contact and you're done. You can also individually interact with elements on business

cards. For instance, you can tap on the phone number and directly place a call, tap on the email address and directly send an email, or even tap on the website and head over to it. It's all incredibly useful and it's surprising that the app isn't used more in such situations.

TRANSLATE TEXT FROM THE REAL WORLD

If you're travelling to another country (in a future where we can do that again), and

you come across a sign in a foreign language, you can use Google Lens to translate the text since it comes with Google Translator built-in! Simply fire up Google Lens and navigate to the Translate mode at the bottom of the screen. Now, point your viewfinder at a sign or any text you'd like to have translated, and Lens will replace the words on your screen with English equivalents. It is extremely effective and accurate in most cases and should save you a lot of time and effort.

**SCAN QR CODES
OR BARCODES**

QR scanning apps are a dime a dozen now, but if you have Google Lens on your smartphone, you can

kiss all the other QR scanning or barcode reading apps goodbye, since Lens can do this as well. Just open up Lens and aim your camera at a QR code or barcode and Lens will offer you the information that the code contains.

**GET STEP BY STEP
GUIDANCE WITH
MATH HOMEWORK**

Powered by Google's acquisition of Socratic, Google Lens can help students take photos of their math homework and get detailed step-by-step solutions for the problems. According to the company, Lens can also help students understand science concepts. Lens will show students graphics

and explanations of the scientific concept they are struggling to understand after scanning the question. To use this feature, open up Lens and navigate to the Homework tab at the bottom of the screen. Point your camera at the problem and click the shutter button. Now, you will see an option called 'Steps to solve'. Click on that and you will be able to see a step-by-step tutorial on how to solve the problem. This same method applies to both math and science questions, though the type of results will vary.
