

Lylux

Funding: US\$ 32,554 pledged of US\$ 8,000 goal

Link: <http://dgit.in/Lylux>

Lylux is a cordless and bladeless hairdryer that frees you from being tethered to one spot when drying and styling your hair. With Lylux, you can now move about the house freely, doing your work or home chores alongside, while also drying your hair. The company also advertises it as a simple way to dry your child or dog's hair, since it is usually hard to keep them grounded to one spot near the power outlet. Lylux doesn't just let you dry your hair while on the move, it

also allows you to dry it quicker with its Fast Drying technology. Sporting a 100,000 rpm motor, Lylux is allegedly three times faster than traditional hair dryers. The dryer also comes with a temperature controller or regulator that ensures that the air

doesn't get too hot since high heat can damage hair extensively. It employs a smart sensor for temperature control that maintains an ideal temperature of 104-degree F throughout the drying process. A narrow, hair smoothing nozzle can also be attached to the head of the dryer magnetically. Lylux is also completely bladeless, so you don't have to worry about your hair being pulled into the dryer and getting irreparably stuck. Lylux comes with a 54Wh battery and charges to full in approximately an hour.

PolySmoother

Funding: US\$ 304,978 pledged of US\$ 5,000 goal

Link: <http://dgit.in/PolySmoother>

If you're familiar with the process of 3D printing, you would know that visible layer lines on a 3D printed model tarnish its entire aesthetic appeal. Plus, they're a dead giveaway that the part you've printed is just a prototype since it looks rough around the edges. While vapour polishing can smooth out these layer lines and leave the model with a nice, reflective finish, the process is difficult and potentially dangerous to perform by yourself. Enter PolySmoother, a machine that automatically vapour polishes 3D prints to help you achieve a smooth finish on 3D printed parts. The machine is essentially an enclosed chamber with a built-in vaporizer. All you need to do is fill its reservoir with the appropriate solvent and place your 3D printed model inside the chamber. The solvent gets heated and vapourised to sort of coat your 3D printed part and create a smooth texture. The process takes only about 15 minutes to complete. After this, you will need to let the part dry for a day or two, and you should be left with a 3D printed part with smooth, layer line-free surface. Since PolySmoother is made out of metal, a wide range of solvents can be used with it. You can use acetone to smooth ABS parts, chloroform to smooth PLA parts, and others.

OmniCase

Funding: US\$ 75,892 pledged of US\$ 5,000 goal

Link: <http://dgit.in/OmniCase>

With the number of gadgets we have in our possession today, it can quickly become very hard to organise and keep track of all your cables. The problem can be solved by purchasing a good cable holder, but what if you could combine it with another utilitarian gadget? The OmniCase is a USB-C docking station that has all the ports you could possibly need for your USB-C devices. Not only that, the OmniCase also comes equipped with a magnetic storage case with slots to secure detachable cables, adapters, and even

your spare SIM card and ejector tool! It helps users declutter their electronic accessories by organising them all in one neat package. With the USB-C hub, you

no longer have to waste your hard-earned money on dongles, it has 7 ports to connect your peripherals while keeping the host device charged at the same time. There are two USB-A 3.0 ports, one

100W USB-C power delivery (PD) charging port, one 4K HDMI output, SD and TF card readers, and one RJ45 Gigabit Ethernet port. The cable and accessory organiser magnetically snaps on to the hub and houses four cables, one SIM card, and an eject pin. The four cables include a USB-A to USB-C Female adapter, a Micro-USB to USB-C female adapter, a USB-C to USB-C cable, and finally a USB-C to lightning cable. The USB-C PD port delivers up to 100W of power which means you can charge most of your devices at full speed. You can also plug your laptop to the OmniCase to stream high definition 4K HDMI video to an external HDTV display, monitor or projector.
