

iPhone SE Plus

Leaks suggest that the iPhone SE successor could feature a 6.1-inch IPS display and a Touch-ID button. <http://dgit.in/feb21-61>

MacBook Redesign

Report suggests that Apple will redesign its MacBook with squared-off edges and physical function keys. <http://dgit.in/feb21-62>

Apple Macbook Pro 13-inch 2020

Setting a new standard

Price
₹1,22,990

Apple launched their usual slew of products in 2020 but also got out a completely new product into the market; the M1 chips, which power the new MacBook Air, MacBook Pro 13-inch and Mac Mini. We have the MacBook Pro 13-inch for review. Let's see how it fared.

BUILD AND DESIGN.....	82
FEATURES.....	84
PERFORMANCE.....	92
VALUE.....	80

Display

The MacBook Pro 13-inch houses a display measuring 13.3-inches with an aspect ratio of 16:10. The resolution on this panel is 2560x1600 and the panel type is IPS-LCD. We edited a few images on the M1 Mac using Adobe Lightroom Classic and found that the colour reproduction was spot on. This is also a very bright panel, clocking 430-nits of brightness in the centre. The display is capable of both HDR10 and Dolby Vision content.

Keyboard, trackpad, and I/O

The new 13-inch MacBook Pro uses scissor switches in its keyboards. The typing experience is really nice thanks to its short, but firm travel. The touchbar has been at the receiving end of a lot of criticism, but we found it quite helpful, especially when it comes to adjusting volume or changing brightness. Then there's the trackpad that continues to set the benchmark for

the industry. Lastly, you get two USB-C ports that conform to the USB4 standard.

Compatibility and usage

When setting up the Apple MacBook Pro 13-inch for review, most of the common apps were not yet optimised for the M1 chip. This includes the Adobe suite of applications. Still, all of these tools were running as smooth and reliably as they do on an Intel-based Mac.

Now, one of the most exciting things about the Macs moving over to ARM-based architecture is the fact that it's now possible to run iOS and iPadOS apps on the Mac. Currently, the selection of iOS and iPadOS apps available via the Mac App Store is still rather weak, but hopefully, that will change in the coming months.

Battery life and sound

The whole allure of Apple's silicon is that these chips were said to offer improved performance in comparison to their Intel counterparts while consuming less power. And boy, does it deliver. On day-to-day usage alone, we were charging the MacBook Pro once in 3 to 4 days. This is with the machine being used to type up documents, research stories, using WhatsApp and Spotify. When we had to edit photos in Adobe Lightroom Classic, we would still be able to use it for 2 days.

The MacBook Pro 13-inch houses some of the best sounding speakers in the market. This machine does not come with the force-cancellation subwoofers we find on the bigger 16-inch model, but these speakers are still well within the realm of impressive.

Performance

The Apple MacBook Pro 13-inch we got is the base variant, which comes with the M1 SoC (8 CPU cores, 8 GPU cores), 8GB memory and 256GB storage. Testing the M1-based Mac does bring some challenges as traditional benchmarking tools do end up taking a performance hit due to the Rosetta 2 translation layer. So our testing stuck to more real-world applications and real-world use.

If you're a video content creator, you'll be happy to know that FCP is already fully optimised for the M1 Macs. In terms of render times, the 5-minute clip (4K to 1080p) was exported in 53 seconds, flat. The 16-inch MacBook Pro, in comparison, takes 58 seconds to complete the same render.

Honestly, this 13-inch MacBook Pro is going toe to toe with the Intel Core i9-based 16-inch MacBook Pro in terms of its performance, while costing less than half the price.

Verdict

To put it simply, the Apple MacBook Pro 13" is simply astounding. With a complete switch in architecture, this machine is squeezing out performance metrics that parallel the top-of-the-line Intel-based MacBook Pro. You also get ridiculously good battery life, and a great display and keyboard.

—Swapnil Mathur

SPECIFICATIONS

DISPLAY: 13.3-inch Retina LED-backlit display with IPS technology | DISPLAY RESOLUTION: 2560x1600 | CHIP: Apple M1 chip | BATTERY LIFE: Up to 17 hours wireless web, Up to 20 hours Apple TV app movie playback | BATTERY TYPE: Built-in 58.2-watt-hour lithium-polymer battery | CHARGER: 61W USB-C Power Adapter | MEMORY: 8GB (Configurable to 16GB) | STORAGE: 256GB (Configurable to 512GB, 1TB or 2TB) | WIRELESS: 802.11ax Wi-Fi 6 wireless networking | BLUETOOTH: Bluetooth 5.0 | CAMERA: 720p FaceTime HD camera | WEIGHT: 1.4 kg | OPERATING SYSTEM: macOS
