

The Witcher 3 on Tesla

Tesla's new Model X and Model S cars can theoretically run The Witcher 3 on a built-in 10-teraflop gaming rig. <http://dgit.in/feb21-85>

Free programming books

Here's a 2021 updated collection of over 100 free, open-source ebooks, covering every language in existence. <http://dgit.in/feb21-86>

The platform also suggests a real-time cost estimate and timeline for the project basis the features and requirements of the customer. We reduce the cost of common-codes by 1/10th, by splitting them across our other customers. Needless to say, the company has fully paid for these libraries and built the features from scratch.

Are you looking at a mass-market approach (let's say you want to service clients who are willing to pay \$60 for a highly templatised app) and is there a timeline for the same?

SDD: COVID-19 hit the most vulnerable businesses (MSMEs) hard as most of them depended on their customers to walk through their doors. Therefore, we wanted to help these local convenience stores, pharmacies, restaurants and all others, survive the rapid acceleration of the shift to online that we've seen in the broader retail industries.

To that end we introduced Studio Store a few months ago – 'digital starter kits' which bundled in all the essential features needed to sell online such as orders, payments, delivery, click & collect and more, and provided it to them at a simple monthly cost split over 24 months. These pre-packaged apps are also supported by Builder Care and Builder Cloud to help them run and scale their business online.

Not only does this help businesses engage their customers online, it also allows them to move away from the costly marketplace model where they give up anywhere between 12% to 30% of their revenues to serve not only new customers, but also their existing customers. We won the CogX Innovation Award 2020 under the "Best COVID-19 Innovation for Recovery" category for what we were able to accomplish through Studio Store.

We are also actively partnering with large organisations at the moment that are already supporting this market (retail banks, telcos, etc), so they can enable their customers to thrive.

These applications can ship in under 2 weeks – which is faster than being able to use any of the well known

SaaS commerce providers but for a native experience!!

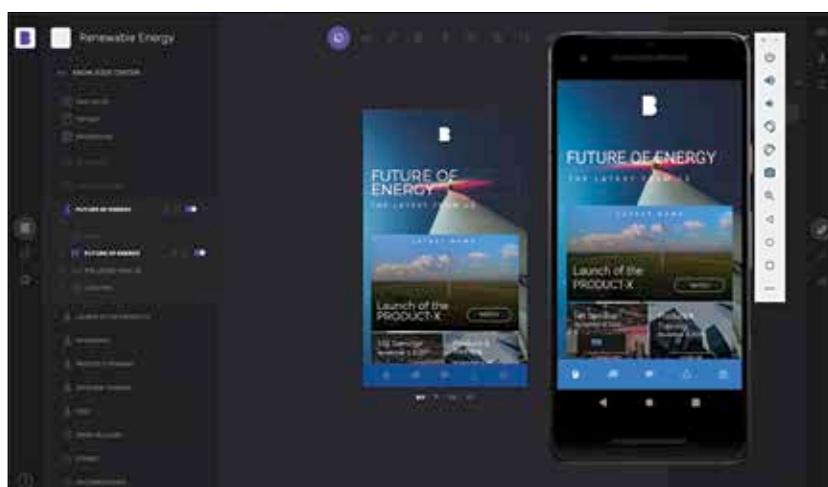

What was the idea around rebranding your startup and what is the new direction that you're following and how different is it from its previous iteration?

SDD: When we founded the company in 2016, we named it Engineer.ai and over time we built 2 key products – Builder and CloudOps. As Engineer.ai, we did some exemplary work with some of the best brands around the world. We built

We also learned that the name 'Engineer.ai' as a product in itself wasn't effective as our customers were not looking to hire engineers but rather order software! They wanted to build!.

The logic behind 'Builder.ai' is simple: we don't just build software; we help companies build phenomenal, revolutionary, business altering ideas.

Builder.ai's ecosystem consists of a full suite of products for all Builders, including: Builder Studio, Builder Cloud and Builder Care. Builder Studio lets you build mobile apps,

Studio Rapid

software that could solve all kinds of problems. From helping Virgin Unite fight for the repeal of the death penalty in the United States to improving healthcare in rural Kerala with Qure, we're proud to have done it all.

As our business grew we realized that we were trying to boil the ocean by having three brands and it was confusing customers.

Halfway through 2018, we decided to review our identity and in early 2019, we brought on board one of the best global creative agencies in London to support us. We wanted to simplify our brand to directly correlate and connect with our product and our customers.

This led us to a huge but obvious realisation – that a lot of our customers were finding it confusing to deal with three different identities – Builder, CloudOps and Engineer.ai – which we feared all along.

websites and wearables – no tech skills needed. Builder Care is your aftercare warranty to make sure your software never goes out of date. Builder Cloud helps enterprises move their operations to the cloud, optimises their cloud infrastructure and even provides big savings on their cloud spend.

As COVID-19 has heavily impacted small and medium-sized businesses, Builder.ai launched its award winning product Studio Store – A new range of pre-packaged apps (E-commerce, Restaurant, Gym, Spa, etc), designed to bring businesses online faster (in less than two weeks) and at a fraction of the cost. Builder.ai's latest product launch – Studio Rapid – enables Enterprise customers to build fully custom native-apps in a day. Studio Rapid is available for enterprise customers starting on a licensed model.
