

RTX 2070 with 16GB VRAM

A YouTuber - ViK-On, demonstrated a way to upgrade the memory on an RTX 2070 from 8GB to 16GB. <http://dgit.in/feb21-59>

Razer Naga X MMO mouse

Targetted towards MMO gamers, the Naga X features 16 programmable buttons and new optical switches. <http://dgit.in/feb21-60>

and then subtract the action time from the reaction time on screen to get the input lag. NVIDIA is moving towards putting a little circuit into monitors which will give you accurate values of system latency. It goes without saying that those monitors will turn out to be expensive but

that doesn't mean you can't apply a little jugaad. One can make a cheap oscilloscope with a Raspberry Pi or Arduino and use the same in the laboratory manner. Or you could couple two sensors, one in the mouse to record your click and the other on the screen to record the reaction (let's

say a muzzle flash's bright light in a game) and then calculate the system latency. I'm working on the latter approaches using the Arduino. Stay tuned to see how that pans out. It might not be as accurate as the laboratory oscilloscope method but it will come close. **A**

BUYING ADVICE

HEADPHONES FOR WORK

Q Hi Agent001, I'm Looking for bluetooth headphones with a mic that will work both for my Macbook and iPhone. Here's what I have in mind:

- Needs to be bluetooth as otherwise the connecting jacks for iPhone and Macbook don't match
- Constraints: Needs to be headphones (comes over the ear) and not earphones/earbuds (goes into ear canal).
- My eardrums seem to have gotten somewhat damaged due to regular use of the regular earphones that come with mobiles, so I need high quality stuff that will auto control the volume / frequency to minimize ear damage, hence, price is not a constraint.
- Please give me options which come with a mic boom and without.
- However, I need them only for my office work. I do not listen to music or watch movies or play games using any listening device

—Vikas Gupta

Jabra Evolve2 65

the volume to levels where they could damage your ears.

I'd recommend either the AirPods Max or the Sony WH-1000XM4 headphones. Both headphones are over-ear headphones (sit over your ears instead of going into the ear canals), have Bluetooth connectivity and solid active noise cancellation performance. If you're using an iPhone, the AirPods Max are an excellent option since you'd be able to take advantage of all of its features, if you wish to.

Sony WH-1000XM4 is a solid all-rounder and its features work well across both Android and iOS.

However, if you do have an iPhone that has iOS 14.2 or later, you can turn on Headphone notifications in the phone's Settings menu. This will send you a notification and automatically lower volume when you've been listening to music at levels that could damage your hearing for a particular period of time. So, in this case AirPods Max would be ideal.

Both these headphones do come with microphones for calls. I'd recommend the Sony WH-1000XM4's microphone over the AirPods Max though. The industry consensus seems to be that the microphone is a bit lacking. And if you want a separate mic boom then check out the Jabra Evolve2 65.

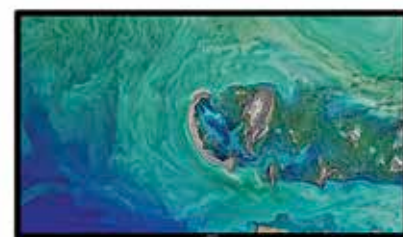

ADDITIONAL MONITOR

Q Hey Agent001, I am looking for a monitor, I

am from India can someone suggest a good one. I already have a laptop which has an Intel Core i3 processor and Intel HD graphics but I want an external display which is bigger to do work on some excel sheets and stuff or say coding. Which is the best 24-inch display? My budget is INR ₹10K.

Thank you and regards,

—Pratap

Acer EB321HQ

A Hey Pratap, I'd say you should start off by checking the maximum output resolution on your laptop's display output port. If you really want a massive screen or an ultra-wide screen for looking at large excel sheets, then a 4K panel in a 27-inch or 32-inch form factor would be best, however, that won't be available in the budget that you've stated. If all you want is a larger panel with FullHD resolution then the Acer EB321HQ should be right up your alley. It's a 32-inch panel and is easy on the eyes thanks to low-bluelight technology that's now a staple in the panel industry. You will have to stretch your budget a little to INR 14K. A decent 4K panel would be around INR 21K which is double your budget. So you're better off with the Acer monitor. **A**

A Hi Vikas, What I'd recommend for your needs is a good pair of noise canceling headphones so that loud external sounds don't cause you to increase
