

with moisture than negative ions used in modern hair dryers, according to Panasonic. The device is also pet-friendly, as per the company. The hairdryer is easy to clean as well, all you need to do is remove the intake filter in the back of the hairdryer. Moreover, the dryer comes with an oscillating quick-dry nozzle. Panasonic says, "The oscillating nozzle evenly distributes the heat generated from the hair drying process to prevent concentrated heat blasts and reduce the chance of overheating hair". The device also houses a diffuser that disperses air more liberally, in order to add more volume to it. Apart from these features, the hairdryer is capable of the basics including hot, warm, and cool temperature options, high and low speeds, and comes with a "cool shot button" that you can hold down to get cooler air quickly. The device is priced at \$150.

ROBOROCK S7 ROBOT VACUUM

Xiaomi-backed Roborock announced its latest robot vacuum at CES 2021 dubbed the Roborock S7. It is a smart robot vacuum that can automatically transition between a vacuum and a mop, and can scrub your floors

up to 3,000 times per minute to get rid of stains and other mess. Unlike most traditional robot vacuums, the Roborock S7 doesn't require users to set up barriers or zones for different surfaces. Using the company's new 'VibraRise' technology, the robot automatically switches to vacuuming mode from mopping mode when it detects carpeted surfaces. Pretty sweet, eh? In case you do want to set up perimeters, you can use the Roborock S7's accompanying app to let you do so. You can also control the bot's path by using the joystick mode to drive it around wherever you please. The mop is lifted as the S7 makes its way back to the charging dock, ensuring that the already-cleaned floors don't get stained again with the remains of dirt on the mop's surface. The Roborock S7 houses a 5,200mAh battery, which promises up to three hours of uninterrupted cleaning. The smart vacuum and mop is priced at \$649.

LG INSTAVIEW RANGE

LG didn't just stop at their InstaView Refrigerators at CES, they also launched the new InstaView Range, a smart oven that features Air Sous Vide mode, Air Fry mode, and an InstaView panel. The InstaView feature is the same as implemented on the refrigerator, two quick knocks on the oven's front surface will illuminate the interior for easy viewing. The InstaView Range also comes with LED-illuminated knobs and the oven

can be controlled via LG's ThinQ app. You can carry out functions such as preheating and monitoring remotely. The most notable feature on this smart oven, however, is the Air Sous Vide mode. The Range cooks food in vacuum-sealed bags (not included with the oven) at precise low temperatures with controlled airflow to lock in flavour and aroma. You can do away with the messy water-based sous vide appliance that usually takes up a large chunk of space on your kitchen counter. LG states that the oven's Air Sous Vide mode is able to maintain any temperature between 100-205 degrees Fahrenheit for up to 48 hours. There's also an Air Frying mode which doesn't require any preheating whatsoever and aims to essentially replace the countertop air fryer as well.

NOBI SMART LAMP

Nobi is a ceiling-mounted smart lamp, created by the Belgian startup of the same name, that can alert caregivers when a fall is detected. The ceiling-mounted light features motion sensors and infrared detection technology to accurately alert caregivers about these precarious incidences, making it a useful gadget for senior citizens that live independently. Each Nobi smart lamp comes equipped with four RGB sensors and it illuminates the room with infrared light so it can detect motion even at night. The lamp will cast a dim upward light if a user simply sits up from their bed. Now, if this user, say an elderly person, wants to visit the bathroom at night, the lamp will detect the motion of getting off the bed and illuminate the path ahead. All

this is achieved by the motion sensors and infrared detectors feeding information into an AI-equipped processor that recognises different movements and positions such as sitting up, laying down, and walking. If Nobi detects a fall, a speaker within the device will ask something along the lines of "did you fall?" If the user says "no"

then the system doesn't do anything, otherwise, it will proceed to alert the emergency contacts the user has entered into the system. The device is capable of sending full RGB images to caregivers or emergency services as well. The light also has a two-way microphone which allows the alerted family member, caregiver, or emergency service representative to speak to the person who has taken a tumble. Nobi can even link to other smart devices, such as a smart lock, and automatically unlock the door to let the caregiver in during an emergency. Additionally, the lamp also comes with a built-in alarm system that can be triggered in case of a home intrusion via a remote or the accompanying app.
