

offer to consumers and professionals as we continue our commitment to delivering best-in-class experiences with instant responsiveness, incredible battery life and fantastic designs. With our PC partners, we are delivering top-quality performance and no-compromise solutions alongside our record-breaking growth in the notebook and desktop space in the previous year."

AMD Ryzen 5000 and Threadripper Pro desktop processors

While the Ryzen 5000 series desktop processors have been out for a while,

we only saw four SKUs in the initial lineup. AMD's announcement at CES introduced two additional processors, Ryzen 9 5900 and Ryzen 7 5800X, joining the family. These are lower TDP versions of the Ryzen 9 5900X and Ryzen 7 5800X. The other announcement was centered around the previously released Threadripper Pro HEDT processors which were hitherto only available in OEM machines being made available to the general consumers. Consumers can purchase the following models directly.

SONY'S NEW 4K AND 8K BRAVIA TVs

At the virtual CES 2021 event, Sony announced its new lineup of Bravia TVs. The lineup includes 4K and 8K TVs some of which are OLED and others which are LED TVs. Unlike LG, who is launching QNED TVs at CES with microLED backlighting, the Sony LED TVs are using traditional LED backlighting. We will have to wait and see how much of a difference microLED backlighting makes to the TVs when we get our hands on them. Sony has been one of the TV brands helming Android TV since the beginning and now, the Sony TVs will come with the Google TV UI found on the new Chromecast. All the TVs will come with HDMI 2.1 support. Coming to the models the new BRAVIA XR televisions include the MASTER Series Z9J 8K LED, MASTER Series A90J and A80J OLED, and X95J and X90J 4K LED.

Until now the brain behind the Sony flagship TVs has been the X1 Ultimate chipset and this year, Sony has introduced a new chipset called the XR, or more specifically the Cognitive Processor XR. The chipset uses "a completely new processing method designed to replicate the ways humans see and hear". Since TVs are getting quite large, rather

than focusing on the entire screen there are times when we will focus on a particular part of the screen or a particular character. So, the processing will ensure that the focal point of content will look its best on the TV while maintaining the best possible details for everything else on the screen.

According to Sony, "the new processor can cross-analyze an array of elements at once, just as our brains do. By doing so, each element is adjusted to its best final outcome, in conjunction with each other, so everything is synchronized and life-like – something that conventional AI cannot achieve".

Sony says that "Cognitive Processor XR can also analyze sound

position in the signal so the sound matches precisely with what's on the screen". This may sound familiar as Sony Acoustic Surface technology found on its OLED TVs like the A8H project sounds from specific parts of the screen to make it so that the sound is coming from where it should rather than below the TV. On Sony OLED

with Acoustic Surface, the entire screen vibrates to produce sound making the entire screen the speaker.

All the 2021 Sony TVs showcased at CES 2021 will come with Google TV. Google unveiled the new UI called Google TV with the new Chromecast, and it looks like the Sony TVs could be the first to come with this new UI. In 2020, we were disappointed that the Sony
