

LINKSYS AXE8400 WI-FI 6E

Belkin showcased their first Wi-Fi 6e router at CES this year, the Linksys AXE8400. The router uses a new version of the Linksys Aware motion-detection technology. The target buyers are people living in smart homes and for those looking to stream 8K video. If your net provider can support that of course. It's also targeted at gamers interested in the latest VR tech. This is a tri-band router, supporting three networks using the spectrum in the 2.4Ghz, 5Ghz, and the newest 6GHz frequency bands. However, unlike most other routers, the Linksys AXE8400 uses mesh networking to provide massive range, up to a massive 3000 square feet per node. The new model will be backwards compatible with Linksys' older Intelligent Mesh technology. The AXE8400 also comes equipped with a 5Gbps WAN port and is outfitted with four gigabit LAN ports and a single USB 3.0 port. Belkin's Linksys Aware motion-sensing tech will be able to recognise third-party stationary Wi-Fi devices; this includes smart plugs, speakers, light bulbs etc, which it will then use to improve its own ability to detect motion inside the home.

RAZER PROJECT HAZEL

When it comes to smart gadgets, the last thing you would be expecting is a smart N95 mask. Well, Razer have gone and made just that, what they're calling the world's first smart N95

respirator. Dubbed Project Hazel, the concept design features a glossy outer shell made out of waterproof, scratch-resistant recycled plastic. The front part of the mask is transparent, allowing people to see your mouth for lip-reading and to see facial expressions.

Razer has categorised Project Hazel as a surgical N95, however, the mask has not earned any of the certifications or approvals from the FDA (Food and Drug Administration), the CDCA (Centers for Disease Control and Prevention) or the OSHA (Occupational Safety and Health Administration). Razer has stated that they're working on the mask with medical experts though.

The main strengths of the mask lie in the two circular areas at sides of

company. The filters are detachable, and rechargeable. No news yet on their battery life and charge time though. Razer is also working on a companion app for the face mask. The amplifiers also house microphones, which will amplify your voice when you speak, through the mask.

OTTERBOX XBOX ACCESSORIES

Smartphone case maker OtterBox entered the gaming space this CES by partnering with Xbox to bring products aimed at console and mobile gamers. While they've come out with a host of accessories, the primary product is a controller shell for the Xbox controller that provides both grip and protection from drops. Or you know, if you tend to throw your controllers around. No confirmation on whether your screen is safe while the controller uses the shell.

Coming to the additional accessories, you have an add-on clip that you can attach to your controller which can hold your smartphone while you game. Then there's a smartphone case made for heat dissipations, and a smartphone screen protector that doubles as a privacy shield. The smartphone clip works regardless

the mouth on either side. These are used for ventilation, and also give the mask a very gas-mask look. These filters will filter the air that's breathed in and the CO2 that's breathed out. They're certified to filter 95 percent of airborne particles, including the COVID-19 virus, according to the

of whether you have the controller shell on or not. It's also collapsible when not in use, so as to take up little space. The Gaming Glass Privacy Guard gives added protection to your screen against scratches, while obscuring the screen for those looking at it from an angle.
