

KFConsole

What we thought to be a joke is actually a rather beefy, or should we say chickeny, console. The KFConsole is a console in the shape of a chicken bucket. That's closer to the actual truth than you might think. The KFConsole actually houses a chamber within the gadget where you can keep your chicken pieces nice and hot.

Created in collaboration with Cooler Master, the KFConsole is no lightweight. It's powered by an Intel Nuc9 Extreme Compute Element; that's an Intel Core i9-9980HK. It comes equipped with an ASUS-built hot-

swappable NVIDIA GPU and Intel CPU. This makes the console upgrade friendly, which is always a good thing. For storage, we've got a 1TB Seagate NVME SSD. Cooler Master have stated that the console will be able to handle just about everything you can throw at it. The bucket will be able to hit 4K @240 fps, will be VR ready, and support ray-tracing. The highlight though is the integrated chicken chamber, which utilises the system's heat and airflow system to keep the chicken hot. We don't have any price or launch date details for the KFConsole as of yet though.

Moon Race

Education company Moon Mark has the first-ever lunar race planned for 2021. Yes, you read that right, a lunar race. No, you're not misunderstanding, it's a race that's going to take place on the moon. Moon Mark has partnered with CO-based Lunar Outpost Golden to make this race a reality. The race will take place using remote controlled cars, remotely controlled from down here on the Earth. We understand if you're a bit disappointed and were expecting actual humans racing cars on the moon. That's still a pretty far ways off.

The RC cars will be designed by high-school kids under the guidance of Frank Stephson, a McLaren P1 designer. Moon Mark has planned an eight-week qualifier for high school kids from around the world to compete with each other. The finals of this qualifier will be the two that race on the Moon. Lunar Outpost will modify their patented Mobile Autonomous Prospecting Platform (MAPP) that was created for developing and controlling lunar rovers for the race. The race cars will be sent to space on a SpaceX Falcon 9 rocket, expected to launch in October 2021.

Impulse Neuro-Controller

Canadian startup Brink Bionics have come up with a device that they claim can detect mouse clicks before your finger even gets a chance to click the button. The device in question is a glove, packed with sensors that looks very similar to the Nintendo Power Glove from way back in the day. What Impulse can reportedly do, is pick up on the electric signals sent by our muscles when we contract them to do actions. In this case, clicking mouse buttons specifically. This signal is interpreted by a special software, which in turn registers a click on your PC. Successfully bypassing this process, i.e., clicking at the point of muscle contraction, can save up to 80ms of clicking time. It might not seem like a big deal, but it's significant enough in the world of professional gaming. In the words

of creator Erik Lloyd, "This is the first time that the human nervous system has been leveraged to optimize performance for gaming and esports in real time." If you're

actually keen on getting your hands into an Impulse, there's an Indiegogo campaign you can check out. Units are expected to start shipping by May 2021.
