Facebook's tussle with Australian Govt

Facebook blocked Australian news websites from sharing their stories on Facebook after the Australian Govt introduced new regulations requiring Facebook to pay news outlets for their content. The block was reversed after the Australian Govt agreed to make changes to the new rules and grant Facebook more time to strike deals with news publishers.

WHAT'S NEW

New IT Act to regulate OTT, social media and digital news

The Indian Government has issued new guidelines under the IT Act, 2000 which have gross implications on OTT services, social media and digital news in the country. As per the new guidelines, social media platforms will be regulated by the IT Ministry, whereas OTT and digital news will be regulated by the Information and Broadcasting Ministry. Social media platforms with a certain number of Indian users will be termed an intermediary as defined in the guidelines and they are expected to enable a mechanism of grievance redressal. As part of the mechanism, social media

companies will be required to have a compliance officer who resides in India and nodal officers who are required to coordinate

with law enforcement agencies. Platforms have to be able to track the origin of messages, and allow users to verify themselves using phone numbers. OTT platforms have to follow rules similar to broadcast. Lastly, there will also be a three-tiered system for grievance redressal.

30,000 Apple Macs infected with Silver Sparrow malware

A mysterious new malware infecting Apple Macs has been discovered by Security researchers. Named Silver Sparrow, the malware has been categorised as high-stealth because of a self-destruct feature that's normally only present in high-stealth operations. Silver Sparrow is capable of running on Apple's new M1

silicon based Mac Books aside from existing Intel based Mac books but it lacks a payload. Researchers believe that Silver Sparrow is uniquely positioned

to deliver an impactful payload at a moments notice. Apple has reportedly already revoked the developer certificates upon finding the malware. The researchers at Red Canary have been working with folks from MalwareBytes, with only the latter having discovered 29,139 infected machines, suggesting far more infections.
