India top victim as 2016 Facebook malware campaign resurfaces

According to a recent report, a 2016 Facebook malware campaign that has been known to use a combination of Windows trojan, browser injections, intelligent scripting, and a bug in the social media platform, has resurfaced again, targeting millions of users, with India being the top victim. According to an investigation conducted by Kaspersky, India ranks first on a list of countries infected by this malware, with 603 infections in January alone. Brazil and Indonesia follow at second and third position respectively. The social media malware campaign was run by a notorious hacker group dubbed SilentFade in 2016 to target Facebook users. Facebook revealed that the group defrauded infected users of over \$4 million, which they used to post malicious ad content across the social network.

MOBILE WATCH

Oppo Find X Series

The upcoming Find X3 line-up is tipped to launch on March 11 and will include the Oppo Find X3 Pro, Find X3 Lite, and Find X3 Neo models. The Oppo Find X3 Pro 5G will be the flagship offering in the series, and it is said to be available in a single variant featuring 12GB of RAM and 256GB storage. The device is expected to be priced between EUR 1,000-1,200. The Oppo Find X3 Pro 5G is rumoured to be a very capable device with flagship specs like a 6.7-inch QHD+ display with a 120Hz refresh rate, a Snapdragon 888 processor, a versatile quad-camera setup, and more. The Oppo Find X3 Neo is next in line, and it is expected to be priced between EUR 700-800 for the 12GB + 256GB variant. That roughly translates to about ₹62,000. Lastly, we have the Oppo Find X3 Lite. It is expected to be priced anywhere between EUR 400-500 (₹35,000 - ₹47,000) for the 8GB+128GB variant.

APP WATCH

LADB

ADB commands are extremely useful on Android smartphones for multiple reasons, allowing users to granularly modify some elements of the smartphone's UI and functionality. For the uninitiated, ADB (Android Debug Bridge) has to be set up on your PC and then one needs to connect the smartphone to the PC via USB cable or Wi-Fi to run these commands. This process can be quite cumbersome. LADB does away with most of these

steps, letting Android 11 users run shell commands right on their smartphone via Android's wireless ADB protocol. The app essentially has an ADB bundled server within its libraries and connects the ADB server to a phone's localhost, tricking the server into believing that the client is a different device. Also, localhost doesn't require an internet connection, so you could use LADB even on Airplane Mode!

Note that LADB is a paid app on the Google Play Store, priced at ₹260. However, you can compile the app for free on Github. The app works thanks

to the new wireless debugging option that is part of Android 11. To set it up, you will need to activate developer

options in your phone's system settings by tapping the phone's Build Number seven times. Now, go to developer options and navigate to wireless debugging. Toggle it on and click Allow. Now, click on wireless debugging and

you'll see an option to pair the device with a pairing code. Enter the code and port number in the LADB app and then it should be set up. Once it's done, you can use LADB for any shell commands you know of or find.

ClipDrop

ClipDrop is an AR app that allows you to copy and paste real-life objects into documents and presentations. The app can pick up any object from your surroundings via the phone's camera with near-perfect edges.

Access Dots

If you're worried about securing your privacy on your smartphone, Access Dots is a great app for you. It lights a few pixels on the top of your screen as a dot to indicate whenever any third-party app is using your smartphone's camera, mic, or GPS.

Ratio

Ratio is a minimalist launcher for Android that streamlines the elements of your phone in an organised manner. The app comes equipped with tiles, themes, and other design and privacy elements.
