Ahoy, Android 12!

A look at some of the confirmed and rumoured features of the much-anticipated Android 12 update

Dhriti Datta | dhriti@digit.in

Since its humble inception, Android OS has consistently been receiving upgrades and refinements over the years, with every new iteration bringing something new to enhance the overall experience of Android devices. Recently, the search giant unveiled the Developer Preview of Android 12 to the public, giving users access to the initial build of the updated OS. The developer preview can now be downloaded on compatible devices, allowing tinkerers and developers the chance to play around with the new and upgraded features

before the final drop of the update (that's about half a year away now).

With Android 12, Google is improving and introducing a plethora of new features including tweaks to media handling and notification support, improvements to privacy, and more polished UI notifications, to name a few. Several new APIs have also been added in an attempt to make the Android ecosystem even more user-friendly. While the developers build is not perfectly representative of what the final build will be, it does give users a decent idea of what they should expect. We'll know even more when the public beta comes around, but for now, let's delve into some of the confirmed features of Android 12 and a few rumoured ones as well. The rumoured features are the ones that are reportedly in the works and hidden as of now. These features may

or may not make it to the final build of Android 12.

CONFIRMED FEATURES

Improved notifications

Google has worked towards improving notifications and the notification shade on Android 12. However, the new look is only a minor change. Instead of the transparent background on the current UI, Google is testing a more opaque background that attempts to match your day/night theme. There's also a thicker brightness toggle bar than what's present on Android 11. Now, it looks more like a thick pill. Additionally, while the look of Quick Settings hasn't changed, the labels under each setting have disappeared, allowing for a cleaner look. It is rumoured that Google is working on another design that places these labels on the sides.

Easier Wi-Fi sharing

In stock Android 11, if you want to quickly share your Wi-Fi connection, you can do that by allowing them to scan a QR code on your smartphone. In Android 12, there's an extra provision that bypasses the barcode scanning. You can just hit the 'Nearby' button underneath the QR code and the phone will use Android's Nearby Share feature to transmit the Wi-Fi details and automatically connect them to your Wi-Fi network. This allows you to share the connection information with multiple

people without having to hand each of them your phone to scan. Definitely more prudent in COVID-19 times!

More screenshot functionalities

With Android 12, Google is improving screenshot editing options. In addition to the already present editing options, Android 12 allows you to add text, emojis and stickers on your screenshot images. This will surely
