Teardown: Fitbit Sense

Chock full of sensors and health features

Dhriti Datta | dhriti@digit.in

The heat and prying opening method

The Fitbit Sense comes apart from the tried-and-tested heat and careful prying method. Much like the Apple Watch, the Fitbit Sense also has ingress protection which means that there's a minuscule gap between the display and the housing of the watch. This gap is lined with an adhesive that requires careful heat application and prying to come apart.

A rival to the Apple Watch

The Fitbit Sense is perfectly posed to rival the Apple Watch Series 6 as a health-focused wearable. The device houses a 1.58-inch AMOLED display and has 4GB internal storage. You also get Wi-Fi, NFC, Bluetooth 5.0 and built-in GPS support. The watch is water-resistant up to 50 meters and comes packing a gyroscope, an altimeter, an accelerometer, and an ambient light sensor. The device also comes with a new ECG function, an optical heart rate monitor, and a skin temperature sensor, that is apt for the times we live in.

Unravelling the watch further

Once the adhesive is sufficiently loosened, you can see the display cable, that is, thankfully, long enough to lift the screen with ease without pulling it apart. Underneath, there's a small bracket that houses tiny T2 Torx screws that cover the connectors. A couple of Torx screws and connectors also hold down the green mainboard to the body.
