TEARDOWN

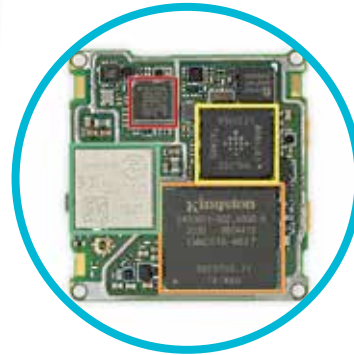

Pop goes the battery

The mainboard of the Fitbit Sense doesn't come out alone, alongside comes the battery which is attached to its underside. The battery that powers this smartwatch is a 1.02Wh cell. This is slightly smaller than the 1.17Wh cell that resides in the Apple Watch Series 6 and even more minuscule when compared to the Xiaomi Watch that houses a larger 2.16Wh pack.

Fitbit
Sense

Accessible silicone

Unlike the Apple Watch that has its mainboard encased in resin, the Fitbit Sense features a more accessible motherboard of sorts. You can find the following chips on the mainboard - MediaTek MT3333 GPS SoC, Kingston EMMC04G-M627 4GB flash memory, Fitbit FBT18SW ARM processor, USI chip, Cirrus Logic CS47L35 Smart Codec with Low Power Audio DSP, Cirrus Logic CS40L25B boosted haptic driver, and a few others.

Other components

Tucked away in two more brackets on the sides of the watch's housing are a few components including a loudspeaker, microphone, vibration motor, and a button. Apart from the vibration motor, all these components are attached to the sensor board at the bottom of the housing and each one terminates in soldered connections.
