

AutoBuff

Funding: US\$ 53,542 pledged of US\$ 3,000 goal

Link: <http://dgit.in/AutoBuff>

AutoBuff is a wireless car polisher that can be used to remove scratches from a car's body. The device distinguishes itself from other standard rotary polishers on the market due to its dual-action movement that makes it easier to control the device and also utilises less energy. AutoBuff comes packing a 4,000mAh battery that lasts for approximately 45 minutes. The device's cordless nature allows users

to polish hard-to-reach areas of the vehicle such as the lower part of the bumper. Weighing merely 1.3 kgs, the AutoBuff is light enough for most people to manoeuvre with ease. The handle is also ergonomically designed for users to have a better

grip. Moreover, the device is also considerably quieter than some other polishers on the market, going as loud as 80db when in operation. AutoBuff allows users to select the polishing speed by simply pressing a button. It has a speed range of 3,400 to 3,800 RPM. Users get three polishing pads with the device including a waffle foam pad for compounding, a flat foam pad for polishing, and a wool pad for finishing.

Wind Catcher

Funding: US\$ 61,713 pledged of US\$ 64,367 goal

Link: <http://dgit.in/WindCatcher>

Wind Catcher is a lightweight, portable, power-generating wind turbine that can generate electricity on the go. Weighing merely 10kgs, the Wind Catcher is essentially a plug-and-play kind of system that can allegedly be set up by one person in a matter of 15 minutes. The device has two variants – the full-sized one and the Lite variant. The Lite variant can generate enough power to charge a laptop while the large one generates a whopping 600-watts at 18 mph. The device has been advertised to be used in three kinds of situations – in off-grid homes such as farmhouses, during an emergency, or as a backup power source. There's also a Wind Catcher app that will intimate users on how much wind power the device is producing, if the device is working as expected, and tracking usage of the generated power. Users can also remotely control the turbine via the app. The device is compatible with most portable generators as well, so you can easily power or charge your gear by harnessing the wind's power. In fact, the device functions fine even at wind speeds as low as 8mph. The contraption can be packed, stored and transported pretty easily due to its foldable nature.

Polaris

Funding: US\$ 1,703,518 pledged of US\$ 25,796 goal

Link: <http://dgit.in/Polaris>

Polaris is a wireless, smart electric tripod head that attempts to make capturing the perfect shot easier. The device is essentially what you'd get if an electric gimbal and a smart camera controller were fused together. It allows users to control the shooting angle remotely when capturing photos or videos. Users can also view live previews of the shots, adjust parameter settings, and assign preprogrammed movements via Polaris' app. This is especially useful if one wants to set up their tripod in treacherous terrain or weather conditions. The photographer can simply set up the tripod, head back over to a safe or com-

fortable location, and then proceed with framing and shooting the subject. The device houses a built-in smart AI-powered controller with a 64-bit ARM processor. This, combined with a Linux-based system, allows the smart tripod head to run independently without relying on the computing abilities of one's smartphone. The device also has Wi-Fi, 4G, GPS, a gyroscope, and a compass to allow users to capture complex shots in a heartbeat. The device can also auto shoot timelapses as per a preprogrammed trajectory that the user sets. It can also snap multiple images to create a panoramic shot. Polaris is even excellent for astrophotography since it comes with in-built data about constellations and can adjust the tripod head in-real to capture the perfect shot of the stars. The unit's base variant costs \$500 and it can get as expensive as \$860.
