

THE BLOCKCHAIN CONDITION

What's the current state of blockchain technology?

Tanmay Patange | feedback@digit.in

History tells us that ledger protocols similar to blockchain date back to the 1980s. Until the mysterious identity behind

Bitcoin, Satoshi Nakamoto introduced the revolutionary whitepaper in 2008, people did not recognize blockchain, a technology that powers cryptocurrencies like Bitcoin. Unlike Bitcoin, which became a buzzword in 2017, blockchain took more time to acquire popular status among businesses, crypto enthusiasts, and regulators. Even so, the adoption rate of blockchain did not hit the roof *per se*. It had a gradual growth, spreading from FinTech to more esoteric uses such as supply chain, health, gaming, energy trading, and food industries.

In 2021, blockchain has become not only a buzzword but also the core pillar of Decentralized Finance (DeFi) that aims to get rid of intermediaries from financial transactions and disrupt the financial sector for a better, decentralized, and more accessible future. However, the current adoption of blockchain does not tell us the full story. As it would eventually become

evident, blockchain did not even impact all the sectors it was expected to disrupt. This difference of impact substantiates the disparity you can see in how different sectors and companies have been dealing with blockchain. Each of them, including the likes of IBM, Ripple, DOC.AI, and Lockheed Martin, has a different story to tell.

Due to the sheer versatility of concepts it offers, it is nearly impossible to explore all the sectors

and companies using blockchain. Instead, we have to focus on the applications aiming to revolutionize their respective industries with the help of blockchain.

TOP SECTORS USING BLOCKCHAIN

▪ Decentralized & Hybrid Finance

Decentralized finance has always been dependent on blockchain. As we know, Bitcoin is considered the first widespread application of blockchain.
