

NAMED GALAXIES

Spot them in the sky

Fireworks galaxy

Many mysterious objects are found in this spotty galaxy, including the Red Ellipse, which could be an unusually large supernova, and dark nebulous lanes.

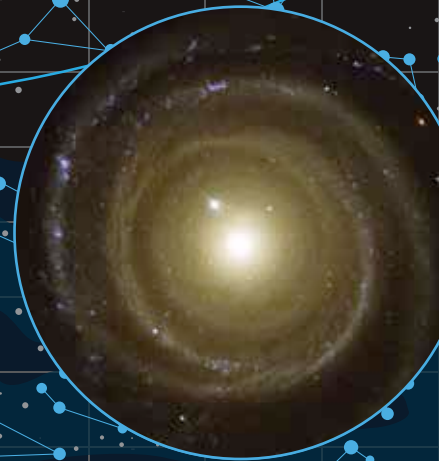

Tadpole galaxy

The shape of the tadpole galaxy is because of a merger 100 million years ago, with the tail of stars stretching across 280,000 light years.

Sagittarius Dwarf Spheroidal Galaxy

This companion galaxy is closer to the Milky Way than Andromeda, and its movement has disrupted the stars at the heart of the Milky Way.

Backward galaxy

The Backward galaxy is an example of a galaxy with leading arms instead of trailing arms, and thus appears to rotate backwards in the sky.
