

AVerMedia Live Gamer MINI GC311

AVerMedia has been in the video capture card business for sometime now. The Live Gamer MINI GC311 is the company's smallest game capture card, small enough that you can carry it around in your pocket. What you have here is a portable external game capture box which can pass through 1080p 60fps videos and capture footage without any latency or load on your CPU. This is because the device comes with its own video

encoder. It's compatible with pretty much any device, be it your gaming console, laptop, desktop (duh), smartphone tablet etc as long as it has an HDMI out. The GC311 comes with an HDMI in and an HDMI out port. Then, unfortunately, you have a microUSB port which powers the device and is used to transfer recorded footage. It

would have been nice if this was a USB-C port. The device works with AVerMedia's RECentral software for streaming and recording videos. The software also comes with streaming overlays and multiple stream support. You do unfortunately need a PC in order to use the device, even if it is compatible with just about anything, which makes it a bit of a hassle if you're trying to record off of something that's far away from a PC.

PRICE: ₹12,500

Amazfit GTR 2e

A more economical variant of the GTR 2 is the Amazfit GTR 2e. Some of the features have been cut down but if you look at it, then you'll notice that none of the make or break features have been dropped.

Instead of 3D curved glass surface with ODL coating you get 2.5D curved glass. Instead of stainless steel, you get aluminium alloy. And there's no Wi-Fi, instead you have Bluetooth Low Energy 5.0 so battery life gets a massive boost and now boasts of a 24 day stand-by time which is 10 more than the GTR 2.

The speaker has been done away with and a new temperature sensor has been included. The UI continues to be easy-to-navigate and the accompanying app, Zepp is quite decently polished. Certain aspects are a bit slower. It takes a long time to pick up your SpO2 levels but that's a problem which plagues most smartwatches since the point of measurement is the wrist. There are plenty of activities pre-programmed into the device which is always a plus point for the folks who love to keep track of their metrics. For the price, the Amazfit GTR 2e manages to stuff in quite a lot.

PRICE: ₹9,999

HyperX Solocast

The HyperX Solocast is a plug and play cardioid microphones

for those who are happy with their current headphones and simply need a good quality mic without all the hassle of needing to tweak around with features. If you're someone who's starting off with streaming, or a podcast of some kind, and you're unsure of how to tweak around with all those mic settings, you might want to consider picking the Solocast up. Additionally, it's quite compact and light, making it fairly easy to carry around.

When we say this is a hassle-free mic, we mean it. As we've already mentioned it's as simple and plug and use, the only other thing you need to bother with is the mute button on the device. That's it, there's no volume sensor, or even software support for this device. As for sound, as per our usage, the audio is pretty clean, of course, positioning is important. Being a cardioid mic, it's important that you speak either into front or from the sides of the mic for optimal sound. Once you've placed it in a decent position, at the right distance – ideally around 4 inches away from your mouth – you can pretty much forget about it.
