Amazon is facing a lawsuit over employees missing lunch breaks and not getting enough rest breaks. <http://digit.in/apr21-01>

Pixel, iPhone data sharing

A study finds that idle Pixels and iPhones share over 1MB of personal data every 12 hours. <http://digit.in/apr21-02>

STARLINK

What you must know about SpaceX's satellite-based internet service

Dhriti Datta | dhriti@digit.in

T

he internet has transformed the way we live our lives and has steadily become more and more

pervasive in the society we live in. While those living in urban areas enjoy speedy internet speeds that even go up to 1Gbps now, there are some areas across the globe that endure internet speeds lower than 20Mbps. Installing fiber connections is lucrative in cities where there are millions of potential customers, but not so much in rural areas that are home to a few thousand people. This is where Elon Musk-backed Starlink can be a true game-changer. For the uninitiated, Starlink is SpaceX's satellite-based internet service. There have been 1,325 Starlink satellites launched to date and has acquired more than 10,000 users globally. Starlink is also offering preorders of the service to more and more countries and cities worldwide. Here's everything you need to know about the ambitious satellite internet service.

HOW STARLINK WORKS

The satellite internet system, Starlink, is capable of delivering internet speeds of 150Mbps theoretically anywhere in the world. Starlink does require a clear view of the sky to function as intended, and the company has stated that even a single tree or pole could cause

issues with the internet speed. The satellite system is currently in the beta testing phase and tests have found the speed to range between 50 and 150Mbps. Reportedly, these numbers are supposed to ramp up as time passes, and is allegedly on track to reach speeds of up to 300Mbps this year. Ultimately, the company

is aiming to reach 1Gbps, and then 10Gbps, internet speeds, but that seems to be a ways away since the service is still in its infancy.

The company, as mentioned previously has already deployed 1,325 Starlink satellites, and aims to bump this number up to nearly 12,000 to ensure full coverage across the globe.
