CUSTOM EMOJIS

Learn how to create your very own custom emojis to express yourself

Dhriti Datta | dhriti@digit.in

W

ith technology having become so intrinsically involved in our everyday lives, emojis have trans-

pired into an essential part of our digital communication. Emojis are everywhere, from your messaging service to your social media channels, they govern how people communicate with each other online. For example, have you ever thought about adding a 'smiley' emoji :-)) after a simple word like 'okay' just to make yourself seem more approachable or polite? Most of us have. However, there are times when there simply isn't a perfect emoji to fit the conversation or the mood. During these times, having a set of tailor-made emojis can be of big help, and let's face it... a bit of fun.

There are many tools, services and apps available online to create

custom emojis that you can use in your digital conversations. You can create unique emojis that define your own emotions and aren't prerendered by Google, Facebook, Instagram, or others. We obviously cannot cover every single method to create custom emojis in the limited space we have, so in this article, we will be focusing on Google's Gboard Emoji Kitchen, Zmoji, Emojily, and Bobble Keyboard.

EMOJI KITCHEN

Google introduced Emoji Kitchen back in February 2020. It is a feature for Gboard users on Android that allows users to combine two emoji to create a new one. So, for the times

you've wanted to convey emotions such as laughing so hard that you feel sick, you can combine the laughing and sick emoji together to create just what you need. Aside from creating your own weird concoction of an

emoji, Google will automatically suggest some emoji mashups for users as well. The emojis will work with apps such as Gmail, Messages by Google, WhatsApp, Snapchat, Telegram, and a few others. Let's delve into how to use Emoji Kitchen.

Firstly, you will need to have Gboard installed on your device. You can download it from the Play Store or App Store. Set the keyboard as default and you can begin using Google's Emoji Kitchen. The feature is no longer in beta, so it should be accessible when you install Gboard right away.

Step 1: Enter any compatible app such as WhatsApp, Gmail, Snapchat, or others, and tap the text entry field that you would use to begin typing.

Step 2: Now, tap the 'Smiley face' icon next to the space bar at the bottom of the keyboard.

You should see an empty

space between the emoji library and the text entry field that has the words 'Tap a smiley to get stickers'.

Step 3: Next, tap and enter two emojis you wish to combine together into the text entry field but DO NOT
