send it. The empty space from the previous step will now display emoji suggestions.

Step 4: The first emoji in this suggestion tray will be a mashup between the two emojis you selected. The tray will also present you with a few more auto suggestions that you can pick from. Select your desired emoji and send it. Note that the emoji will be sent as a sticker.

In December 2020, Google extended its Emoji Kitchen to include over 14,000 mashup emoji stickers, so the possibilities are endless. You can even make a shocked pineapple emoji or a monkey sheriff... Just keep playing around with it and you'll be surprised and amused by the combinations you can come up with to perfectly express your emotions in conversations.

ZMOJI

Zmoji is a lot like Bitmoji, where it helps users create custom emoticons from photos or manually. You

can also tweak the photo-generated avatar manually later on if you're not satisfied with the results. Zmoji allows users to tweak every aspect of their avatars including facial features, hairstyles, face type, facial hair, clothing, and much more. Once you've created the Zmoji stickers, the app will ask you to enable Zmoji's keyboard to send your custom emojis to anyone. You can download the Zmoji app via App Store on iOS or by using an APK on Android. Let's get into how to make your custom avatars on Zmoji.

Step 1: Open the Zmoji app and choose your gender and avatar style.

You can choose between Zmoji Classic and Zmoji Deluxe styles as per your preference. Next, pick either facial recognition or manual creation to get started with making your custom emojis.

Step 2: If you chose Facial Recognition, take a selfie of yourself and the app will generate a cartoon avatar of yourself in a few seconds.

Step 3: If you chose manual creation, or if you want to tweak the photo-generated avatar, you will have the option to tweak their facial features, clothing, hairstyles, and more. You can also select the posture and expression you'd like for your custom avatar.

Step 4: Once you've achieved your desired results with the emoji, head over to 'Avatar Gallery' and click the share button to save your cartoon avatar. You can now use them in text messages, social media apps, and more.

Step 5: After you've created your avatar, the app will auto-create tons of avatar emojis, GIFs and stickers for you to pick from.

EMOJILY

If you've been looking to expand beyond your usual set of emojis, Emojily is a great option. The app offers intricate control over almost every aspect of the emoji creation process, making

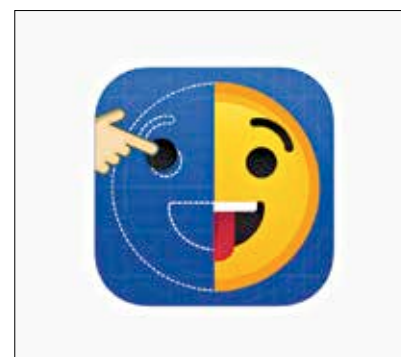

it one of the better custom emoji creation apps in the market. The app has been, unfortunately, removed from the Google Play Store but for Android, there are alternatives such as Emoji Maker that works almost exactly the same as Emojily.

Emojily is free to install but it does have in-app purchase starting at \$0.99. You can make your own custom emojis, try out randomised features for emojis, and share them with your friends in chat, iMessage or social media apps. Let's get into how to make custom emojis on Emojily.

Step 1: First, launch the app. You will get an option to create a new

emoji or get a random auto-created emoji. Select the former option to make your own emoji. However, don't stray away from the latter option since it often spews out some amusing creations.

Step 2: Once you've selected the create new emoji option, you will get a base template for your custom emoji. Now, you can add an array of elements to this template such as

eyes, eyebrows, hands, mouth, and more. You can even change the base template upon which you create the features of your emoticon.

Step 3: Once you have finalised your emoji design, tap the save button on the left side to download your custom emoji to your phone's photo library. You can also directly share it with your friends by tapping the share button.

Note that the free version of Emojily only gives users access to limited elements. You will need to purchase the locked elements through in-app purchases.

Emojily also has its own keyboard that can be used in iMessage or other apps to directly use the created emojis. To use this in iMessage:

- In iMessage, tap the > button and then tap the App Store button
- Now, tap the bottom left 'app drawer' button
- Tap + and then click on the Manage tap
- Switch on Emojily and then tap 'Done'
- Now, simply tap the Emojily icon to use your saved custom emojis
