A COLLECTION OF PRO TIPS FOR EVERYTHING. Without being limited to a particular topic, these tips are from popular software, to coding, to browsers, search, storage rules, password rules, mobile device hacks, bios cracking, tweaks explained and everything tech under the sun.

Android Debug Bridge

If you're itching to do more with your Android phone, here are some ADB tricks you can try

ADB OR ANDROID DEBUG BRIDGE IS AN EXTREMELY VERSATILE COMMAND-LINE TOOL that enables users to control their Android device via a PC. The tool is indispensable for developers since it allows them to perform numerous programming actions and check the behaviour of the system when an app is running. It allows them to easily troubleshoot or debug their apps. Nevertheless, even if you're an average user, you can use a few useful ADB commands with ease that grants you more access and control over the workings

of your device. Here are some nifty things you can do with Android Debug Bridge.

SETTING UP ADB

Before we get into any tips and tricks, in order to use ADB commands, you first need to set it up. Firstly, you will need to enable USB debugging on your Android device. In order to do this, you will need to enable Developer Options. To enable this, go to your phone's Settings and go to 'About Phone'. Now, find 'Build Number' and tap on it 7 times consecutively to enable Developer Options. Note

that Android devices with different UIs may have Build Number under some other page, so you will have to look for it. Now, find and enter the Developer Options in your phone's Settings Menu. Next, enable 'USB Debugging' in Developer Options. Now, connect your smartphone to your computer and select the 'File Transfer' mode.

Next, we have to set up ADB on your PC. There are methods to do this on Windows, Mac, Linux, and Chrome OS. In this tutorial, we will be covering how to set up ADB on Windows, however, if

you have Mac, Linux or ChromeOS, there are plenty of tutorials online to show you exactly how to do it. On your Windows PC, download ADB Platform Tools for Windows (<http://dgit.in/SDKPlatform-Tools>). Extract the contents of the ZIP file on your PC. Head over to the extracted folder and click on the address bar and type 'cmd' and hit enter. A command prompt window will pop up in the ADB directory. Now, simply connect your Android device to the Windows PC and you execute the following command-
adb devices

A prompt will pop up on your phone asking you to allow USB debugging. Enable the 'Always allow from this computer' checkbox and tap on 'Allow'. Now, type the "adb devices" command again and you will see your device's serial number in the Command Prompt window. ADB is now successfully installed on your PC.

Android 11 and higher supports wireless ADB control allowing you to run ADB commands without having to connect your PC and smartphone with a data cable. To do this, make sure you have the latest version of SDK Platform Tools. Now, on your Android smartphone, head over to Developer Options and enable 'Wireless debugging'. A dialogue
