

Xiaomi Mi 11

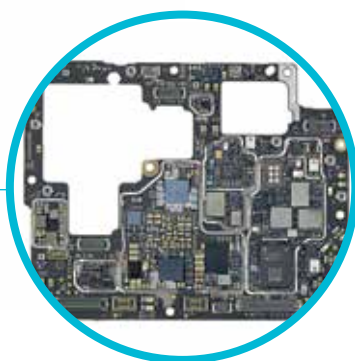

Display and cooling system

The Mi 11 houses the power-hungry AMOLED DotDisplay with 120Hz adaptive refresh rate and a WQHD+ resolution (3200 x 1440 pixels). It also packs a touch sampling rate of 480 Hz! The curved display on the phone is painful to remove but finally makes way after some prying. Under the display, there's the optical in-display fingerprint sensor by Goodix that requires a bit of gentle pulling to come off. Lastly, the Mi 11's vapour chamber cooling system can be peeled apart.

Dual battery cells

The battery is obstructed by a few cables that can be easily removed with some handy pull tabs. The Mi 11 houses a 17.8Wh battery which is slightly lower than the 18.4Wh battery in the Mi 10. The battery seems like it may be slightly inadequate for the large 120Hz screen and the latest Snapdragon 888 SoC, but only tests will tell the true story. The battery actually consists of two separate 2300mAh cells connected in parallel. Charging two cells via separate connectors allows the phone to have faster charging speeds.

Of chips and sensors

The Mi 11 comes with a plethora of chips including the Qualcomm SM8350 Snapdragon 888 SoC (5nm). It is the first phone to house this chip globally. There's also an integrated X60 modem layered under the Samsung K3LK7K70BM-BGCP 16 Gb LPDDR5 3200MHz RAM. Other chips include SK Hynix HN8T05BZGK 128GB flash memory chip, Wi-Fi/BT 5.2 WCN 6851 Wi-Fi 6 wireless combo SoC, Qualcomm SDR868-RF transceiver chip, and others. There are also a few sensors such as the accelerometer and gyroscope, a pressure sensor, and others.
